

Manufacturing with Mathematics

From shoes to computers, mathematics helps manufacturers make things faster, cheaper, and better.

Materials design and production

Mathematics is used to develop strong but lightweight metals, ceramics and composite materials by modeling materials design and production. Models can identify new material possibilities, explore processing routes, and solve complex production problems such as creating lightweight yet durable fabrics.

Mathematical simulations bring costs down and get new products to the market faster.

Mathematical modeling of parts and assemblies

A century ago, individual components of manufactured goods were designed by drawing shapes and figures on paper. Now, most parts are designed using precise mathematical models that dramatically improve upon the former labor-intensive and error-prone process.

3D printing relies on detailed mathematical models of part size, shape, and material composition.

Chemical finishing and milling

Mathematical techniques lower the cost and improve the quality of machined parts. Chemical finishing, which changes the surface of an object to enhance its appearance or durability, depends on solving sophisticated mathematics problems to find the correct chemical concentration and timing. This reduces waste and lessens the environmental impact.

Computer Numerical Control (CNC) programming

CNC-equipped manufacturing tools permit devices—like 3D printers, drills, cutters, mills, and robots—to fabricate parts and assemblies through the mathematical specification of the paths of motion for such tools.

Specifying these paths in high-dimensional mathematical models permits the complex motions needed for parts to be coded in repeatable, accurate ways that lead to lower costs and manufactured goods of higher quality.

Robotic arms—used in sorting, assembly, and packing—have mathematical controls that automatically adjust to ambient temperature, humidity, and even the current condition of the machines.

Models for making composite parts in an autoclave—a giant pressure cooker—depend on simultaneously solving the heat equation and a dynamical system that describes movement of particles over time.

Assembly and statistical process control

Complex statistical models aid in product assembly and help to ensure the quality of the finished result.

The assembly process—including placing subparts, securing them together, drilling fastener holes, and installing fasteners—can be complicated by issues such as measurement error, temperature, material deformations, and distortions. Modeling can help capture these phenomena and enable errors to be analyzed and corrected sooner rather than later.

Distribution networks

A field called operations research helps to manage logistics and efficiently distribute finished goods to wholesalers and retailers. High-dimensional linear and non-linear models of cost structure and consumer demand optimize the distribution network to make sure goods get to the people who depend on them.

Mathematics In Process:

Handbook of the History and Philosophy of Mathematical Practice Bharath Sriraman, 2024-04-26 The purpose of this unique handbook is to examine the transformation of the philosophy of mathematics from its origins in the history of mathematical practice to the present. It aims to synthesize what is known and what has unfolded so far as well as to explore directions in which the study of the philosophy of mathematics as evident in increasingly diverse mathematical practices is headed. Each section offers insights into the origins, debates, methodologies, and newer perspectives that characterize the discipline today. Contributions are written by scholars from mathematics, history, and philosophy as well as other disciplines that have contributed to the richness of perspectives abundant in the study of philosophy today who describe various mathematical practices throughout different time periods and contrast them with the development of philosophy.

Editorial Board: Andrew Aberdein (Florida Institute of Technology USA), Jody Azzouni (Tufts University USA), Otávio Bueno (University of Miami USA), William Byers (Concordia University Canada), Carlo Cellucci (Sapienza University of Rome Italy), Chandler Davis (University of Toronto Canada), 1926-2022 Paul Ernest (University of Exeter UK), Michele Friend (George Washington University USA), Reuben Hersch (University of New Mexico USA), 1927-2020 Kyeong Hwa Lee (Seoul National University South Korea), Yuri Manin (Max Planck Institute for Mathematics Germany), 1937-2023 Athanase Papadopoulos (University of Strasbourg France), Ulf Persson (Chalmers University of Technology Sweden), John Stillwell (University of San Francisco USA), David Tall (University of Warwick UK), 1941-2024.

This book, with its exciting depth and breadth, illuminates us about the history, practice, and the very language of our subject about the role of abstraction, of proof, and manners of proof about the interplay of fundamental intuitions about algebraic thought in contrast to geometric thought. The richness of mathematics and the philosophy encompassing it is splendidly exhibited over the wide range of time these volumes cover from deep platonic and neoplatonic influences to the most current experimental approaches. Enriched as well with vivid biographies and brilliant personal essays written by and about people who play an important role in our tradition, this extraordinary collection of essays is fittingly dedicated to the memory of Chandler Davis, Reuben Hersch, and Yuri Manin. Barry Mazur, Gerhard Gade, University Professor, Harvard University. This encyclopedic Handbook will be a treat for all those interested in the history and philosophy of mathematics. Whether one is interested in individuals from Pythagoras through Newton and Leibniz to Grothendieck, fields, geometry, algebra, number theory, logic, probability, analysis, viewpoints from Platonism to Intuitionism, or methods, proof, experiment, computer assistance, the reader will find a multitude of chapters that inform and fascinate. John Stillwell, Emeritus Professor of Mathematics, University of San Francisco. Recipient of the 2005 Chauvenet Prize. Dedicating a volume to the memory of three mathematicians, Chandler Davis, Reuben Hersch, and Yuri Manin, who went out of their way to show to a broader audience that mathematics is more than what they might think is an excellent initiative. Gathering authors coming from many different backgrounds but who are very strict about the essays they write was

Reflections on the lessons of COVID 19 Explorations of new technological opportunities *The Making of Mathematics*
Carlo Cellucci, 2022-03-07 This book offers an alternative to current philosophy of mathematics heuristic philosophy of mathematics In accordance with the heuristic approach the philosophy of mathematics must concern itself with the making of mathematics and in particular with mathematical discovery In the past century mainstream philosophy of mathematics has claimed that the philosophy of mathematics cannot concern itself with the making of mathematics but only with finished mathematics namely mathematics as presented in published works On this basis mainstream philosophy of mathematics has maintained that mathematics is theorem proving by the axiomatic method This view has turned out to be untenable because of G del s incompleteness theorems which have shown that the view that mathematics is theorem proving by the axiomatic method does not account for a large number of basic features of mathematics By using the heuristic approach this book argues that mathematics is not theorem proving by the axiomatic method but is rather problem solving by the analytic method The author argues that this view can account for the main items of the mathematical process those being mathematical objects demonstrations definitions diagrams notations explanations applicability beauty and the role of mathematical knowledge *Mathematics Learning in Early Childhood* National Research Council, Division of Behavioral and Social Sciences and Education, Center for Education, Committee on Early Childhood Mathematics, 2009-11-13 Early childhood mathematics is vitally important for young children s present and future educational success Research demonstrates that virtually all young children have the capability to learn and become competent in mathematics Furthermore young children enjoy their early informal experiences with mathematics Unfortunately many children s potential in mathematics is not fully realized especially those children who are economically disadvantaged This is due in part to a lack of opportunities to learn mathematics in early childhood settings or through everyday experiences in the home and in their communities Improvements in early childhood mathematics education can provide young children with the foundation for school success Relying on a comprehensive review of the research *Mathematics Learning in Early Childhood* lays out the critical areas that should be the focus of young children s early mathematics education explores the extent to which they are currently being incorporated in early childhood settings and identifies the changes needed to improve the quality of mathematics experiences for young children This book serves as a call to action to improve the state of early childhood mathematics It will be especially useful for policy makers and practitioners those who work directly with children and their families in shaping the policies that affect the education of young children
