Observing The Moon Practical Astronomy Hardcover:

Observing the Moon Peter T. Wlasuk, 2013-04-17 Why write another guide to observing the Moon That was the question I was pondering as I began this project having a fine collection of classic lunar guidebooks dating back to 1791 in my own library As a Fellow of the Royal Astronomical Society RAS member of the American Astronomical Society's Division for Planetary Sciences AAS DPS and member of the American Geophysical Union AGU I am fortunate to know many professional lunar scientists who keep me up to date with developments in lunar science contrary to public perception lunar science has definitely not stagnated since the last Apollo No 17 left the surface of the Moon in December 1972 I am also lucky to know many amateur lunar observers who like me enjoy actually looking at the Moon with telescopes and imaging it with a wide variety of devices ranging from regular 35 mm cameras to video recorders and CCD cameras My friends who study the Moon whether in their professions or just for fun gave me several reasons for doing another lunar guidebook First the last lunar observer's guide of any length was published over ten years ago and many reviewers noted that it was badly out of date even then *Astronomical Sketching: A Step-by-Step Introduction* Richard Handy, David B. Moody, Jeremy Perez, Erika Rix, Sol Robbins, 2007-06-12 This book presents the amateur with fine examples of astronomical sketches and step by step tutorials in each medium including pencil pen and ink chalks and pastels painting and computer graphics programs This unique book can teach almost anyone to create beautiful sketches of celestial objects by following simple illustrated step by step instructions Readers can select a chapter related to their preferred class of object and rapidly learn techniques in several media Each chapter contains useful information regarding equipment techniques for preserving and archiving sketches and suggestions for accurate record keeping *Guide to Observing Deep-Sky Objects* Jeff Farinacci, 2008 *Guide to Observing Deep Sky Objects* is an invaluable reference for all amateur astronomers The book contains for each constellation 1 a star chart showing the Bayer labels 2 a table for many of the stars in the constellation along with their positions and magnitudes and 3 a table of the major deep sky objects in the constellation with relevant observational data Facing pages provide unique year long graphs that show when the constellation is visible in the sky which allows the user to quickly determine whether a given constellation can be seen and when the best time to see it will be *Spectroscopy: The Key to the Stars* Keith Robinson, 2007-08-15 While most amateur astronomers know about the red shift have a general idea of the way that the emission and absorption lines in stellar spectra provide an insight into the atomic processes of the star it is unusual to find someone who has any kind of detailed knowledge The reason isn't lack of interest far from it but is because all the books currently available are pitched at professional astronomers and degree students and are to say the least difficult to read This is the first non technical book on this subject written specifically for practical amateur astronomers It includes all the science necessary for a qualitative understanding of stellar spectra but avoids a mathematical treatment which would alienate many of its intended readers Any amateur astronomer who carries out or who is interested in observational

spectroscopy and who wants a non technical account of the physical processes which determine the intensity and profile morphology of lines in stellar spectra will find this is the only book written specially for him And of course armchair astronomers who simply want to understand the physical processes which shape lines in stellar spectra will find this book equally fascinating *Observing the Sun with Coronado™ Telescopes* Philip Pugh,2007-11-07 For this ground breaking book Philip Pugh has assembled a team of contributors who show just how much solar observation work can be accomplished with Coronado telescopes and explain how to get the best from these marvelous instruments The book shows that Solar prominences filaments flares sunspots plage and active regions are all visible and can be imaged to produce spectacular solar photographs **NASA EP.** United States. National Aeronautics and Space Administration,1961 **Observing the Moon** Gerald North,2000-07-27 Written by an experienced and well known lunar observer this is a hands on primer for the aspiring observer of the Moon Whether you are a novice or are already experienced in practical astronomy you will find plenty in this book to help you raise your game to the next level and beyond The author provides extensive practical advice and sophisticated background knowledge of the Moon and of lunar observation The selection construction of equipment and optimizing of existing equipment for such projects as drawing photographing and CCD imaging of the Moon are covered together with analysis and computer processing images and much much more Learn what scientists have discovered about our Moon and what mysteries remain still to be solved Find out how you can take part in the efforts to solve these mysteries as well as enjoying the Moon s spectacular magnificance for yourself **Observing Variable Stars, Novae and Supernovae** Gerald North,Nick James,2014-08-21 Gerald North s complete practical guide and resource package instructs amateur astronomers in observing and monitoring variable stars and other objects of variable brightness Descriptions of the objects are accompanied by explanations of the background astrophysics providing readers with real insight into what they are observing at the telescope The main instrumental requirements for observing and estimating the brightness of objects by visual means and by CCD photometry are detailed and there is advice on the selection of equipment The book contains a CD ROM packed with resources including hundreds of light curves and over 600 printable finder charts Containing extensive practical advice this comprehensive guide is an invaluable resource for amateur astronomers of all levels from novices to more advanced observers Gerald North is a lifelong amateur astronomer In addition to being a member of the British Astronomical Association since 1977 he is also the author of many books including *Advanced Amateur Astronomy* Cambridge 1997 and *Observing the Moon* Cambridge 2000 *A User's Guide to the Meade LXD55 and LXD75 Telescopes* Martin Peston,2010-04-28 I have owned telescopes for over 25 years since I was a young lad I purchased an LXD55 AR 6 Refractor in 2002 and was one of the first to own one in the UK I am also a proud owner of an LXD75 SC 8 Armed with these two very different telescopes I have spent many hours searching the skies for interesting objects using Meade s Autostar Goto facility My motivation to write a book about the LXD Goto telescope series first came from comments about an LXD55 AR 6

Refractor review that was published on the LXD55 com website From then on I have had regular emails from people asking technical questions about the telescope and which model is best suited for them Whilst attending Star parties in the UK I found that many LXD owners would struggle to use them even at a basic level especially if they have never owned or used an equatorially mounted Goto telescope before Since the first LXD55 models came out in early 2002 owners have struggled to find useful information to help them use the telescopes to the best advantage There have been mixed reactions about its quality and performance Hence this book is directed towards those who are new to Goto and the LXD telescope **The**

Forthenextyearwewilltakeajourneytogetheracrossthenight sky In these pages you will find lunar features planets meteor showers single and multiple stars open and globular clusters as well as distant galaxies There will be astronomy history to explore famous astronomers to meet and science to learn You ll find things here for those who enjoy stargazing with just their eyes binoculars or even the largest of telescopes Although these observing tips are designed with all readers in mind not everyone lives in the same time zone or the same hemisphere and certainly no one has clear skies every night But no matter where you live or who you are it is my hope that somewhere here you find something of interest to keep you looking up LearningtheNightSky If you are new to astronomy it might seem difficult to learn all those stars Relax It s much easier than you think Just like moving to a new city everything will seem unfamiliar at first but with a little help from some maps you ll soon be finding your way around like a pro Once you become familiar with the constellations and how they appear to move across the night sky the rest is easy If you do not have maps of your own try visiting your local library or one of many online sites thatcangeneratethem Theygiveobjectpositionsingreatdetail andmosthaveakeyofGreekletters to help you understand star hop instructions **Setting-Up a Small Observatory: From Concept to Construction** David

Arditti,2007-12-20 Arditti s approachable work covers the all the details of design siting and construction once a basic type has been decided upon It is written in a way that is equally applicable to the USA and UK where there are slightly different building regulations and deals with matters that are basic to building and commissioning any amateur observatory Uniquely David Arditti also considers the aesthetics of amateur observatories fitting them in with family and neighbors and maybe disguising them as more common garden buildings if necessary Every amateur astronomer who wants a purpose built observatory and let s face it which one of them doesn t will find this book invaluable **My Heavens!** Gordon

Rogers,2007-10-28 My Heavens charts the progress of the author s own substantial observatory with additional material from amateur constructors of large observatories elsewhere from conception through design planning and construction to using an observatory of the kind that all amateur astronomers would aspire to own This book tells the warts and all story of small beginnings in amateur astronomy leading to the construction of a top of the range observatory at a house on the edge of a

country village between Oxford and London The author is a qualified building surveyor and looks at building the observatory from his own professional perspective There were of course many errors problems technical and organizational difficulties along the way and the author never shies away from admitting his mistakes and in doing so he reduces the chances of others falling into the same traps Comparisons are made with similar large projects in the USA taking a look at the differences and similarities in planning and building regulations and in construction methods on both sides of the Atlantic Eventually an observatory materialized set up to facilitate the taking of very high quality images of the deep sky on those special days of best seeing The story doesn't end with the construction of the observatory but goes on to describe the author's choice of equipment setting it up and his own techniques for obtaining superb astronomical images like the ones he shows in his book

Astrophysics is Easy! Mike Inglis, 2007-07-14 Astrophysics is a subject that is often with some justification regarded as extremely difficult requiring at least degree level mathematics as a prerequisite to its understanding Consequently many amateur astronomers just don't bother and miss out on the fascinating fundamentals of the subject and often on an understanding of exactly what they are observing Mike Inglis quantitative approach to astrophysics cuts through all the incomprehensible mathematics and explains all aspects of astrophysics in simple terms A unique feature of this book is the way that example objects for practical observation are given at every stage so that practical astronomers can go and look at the object or objects under discussion using only commercial amateur equipment **Library Journal** Melvil

Dewey, Richard Rogers Bowker, L. Pylodet, Charles Ammi Cutter, Bertine Emma Weston, Karl Brown, Helen E. Wessells, 2005 Includes beginning Sept 15 1954 and on the 15th of each month Sept May a special section School library journal ISSN 0000 0035 called Junior libraries 1954 May 1961 Also issued separately *Lights in the Sky* Michael Maunder, 2007-09-28 Many

lights and other objects in the sky go unrecognised or at least are little understood by those observing them Such things range from the commonplace like rainbows and meteors to the distinctly unusual like the green flash and ball lightning And there is still a residuum of objects that remain unidentified by the watcher classed generally as UFOs a description which today has connotations of the mysterious even of extraterrestrial visitors The first part of this book is an identification guide very much like the plant identifier sections found in a good gardening or botany book It allows quick and structured identification of known aerial phenomena whether at night or during the day The objects thus found are referenced to the second part of the book The second part gives a full description physical explanation and where relevant notes on observing and photographing the various phenomena Some will need optical aids such as binoculars or telescopes but the main thrust of the book is identification and explanation rather than imaging The final chapter approaches UFOs from a scientific standpoint particularly the way in which human perception and often preconception affects the outcome It does however finish with a short section on extraterrestrial UFOs emphasising the burden of proof aspect and touching on the scientific theories of life on other worlds and the improbability of visitors **Aurora** Neil Bone, 2007-06-05 This new book addresses a

gap in the literature offering an explanation of the aurora's causes how the occurrence of major events may now be predicted and how amateur observers can go about recording displays This is the first serious book about aurora written for practical but non professional observers It provides a concise accessible description of the various auroral forms and how to record them illustrated with color images of recent displays It contains details of Space Weather forecasting websites how to interpret and use the information given on these and how to anticipate auroral activity *Making Beautiful Deep-Sky Images* Greg Parker, 2007-09-20 This book is based around the author's beautiful and sometimes awe inspiring color images and mosaics of deep sky objects The book describes how similar Hubble class images can be created by amateur astronomers in their back garden using commercially available telescopes and CCD cameras Subsequent processing and image enhancement in the electronic darkroom is covered in detail as well A range of telescopes and equipment is considered from the author's 11 inch with Hyperstar camera down to more affordable instruments Appendices provide links to free software not available from a single source and are themselves an invaluable resource *Sketching the Moon* Richard Handy, Deirdre Kelleghan, Thomas McCague, Erika Rix, Sally Russell, 2011-12-11 For anyone artistically inclined observing the Moon and attempting to sketch or paint it can easily become a passion The Moon presents a broad array of tone texture and form Capturing this in a painting or sketch at the eyepiece of a telescope or even with binoculars develops observational skills leaves a record of the observation and can also be a delightful and rewarding pastime However the choice of media available is extensive acrylic paint oils pen charcoal etc and even computer art programs and there is no existing text that fully explains all lunar sketching and painting techniques in each respective medium This beautiful and graphically rich book fulfills this requirement It presents detailed step by step instructions in the form of illustrated tutorials for every major medium employed to represent the Moon It also provides practical advice on how to sketch outdoors at night not ideal conditions for an artist This is easily the most extensive book on the subject of lunar art for amateur astronomers particularly those observing through a telescope The diverse features of the lunar surface will attract and entice readers to review the number of different media presented exciting and inspiring them with the possibilities of learning to depict all of the fascinating aspects of Earth's very own satellite *Astronomy Now*, 2008 *The Griffith Observer*, 1998
