Rosen, 1995-11-29 gar discusses recent studies of the SF gene promoter that may be relevant to understanding the detailed molecular mechanisms by which soluble factors regulate SF production Polverini and Nickoloff discuss another mechanism by which SF may enhance tumor growth ie stimulation of angiogenesis the formation of new blood vessels from pre existing microvessels Angiogenesis is required for continued growth of most solid tumors and provides a mechanism by which the stroma may continue to grow along with the tumor cells Although endothelial cells are stromal cells they express a number of epithelial characteristics including i epithelial like tight junctions and junctional proteins ii the ability to organize into flat tened tubular structures iii the c met receptor protein and iv biologic responsiveness to SF It is perhaps not surprising that vascular endothelial cells may both produce and respond to SF in different situations Epithelialness may be defined in two ways i expression of generic epithelial structures and proteins eg specialized junctions junctional proteins eg cadherins ZO1 cytokeratins and ii production of specific differentiated products eg milk proteins by mammary epithelia renin by renal tubular epithelia of the juxtaglomerular apparatus Recent studies suggest that SF Ic met signalling may mediate epithelia mesenchyme interconversion in part by modifying some of the generic epithelial characteristics Nusrat discusses the effects of SF on the epithelial junctional apparatus Relatively little is known about whether and how SF regulates cell specific differentiation Cancer Metastasis, Molecular and Cellular Mechanisms and Clinical Intervention Wen G. Jiang, R.E. Mansel, 2006-04-11 This book covers the molecular and cellular aspects of cancer metastasis and discusses the clinical aspect of micro and macro metastases which result in the death of the majority of patients with cancer The current edition attempts to examine the current status of the basic scientific and clinical research in the area and is a very useful reference for clinicians oncologists and biologists It is intended for undergraduates as well as postgraduates in the area of medicine oncology and cancer biology *Spheroid Culture in Cancer Research (1991)* Rolf Bjerkvig, 2017-11-22 Spheroid Culture in Cancer Research describes the various techniques now available for establishing spheroid tissue culture including spheroid culture from normal tissues and from tumor cell lines The book also describes how the spheroid system can be used to study interactions between normal and malignant cells Microenvironmental conditions in spheroids and how this micromilieu may promote cellular heterogeneity and histiotypic structures not observed in corresponding monolayer cultures are discussed The biological importance of oxygen tension pH gradients diffusions of nutrients and cell cell communication in spheroids are also examined The book will be profoundly important to researchers in experimental chemotherapy radiotherapy immunotherapy and hyperthermia *Cancer Metastasis — Related Genes* D.R. Welch, 2006-04-11 Being diagnosed with cancer is devastating But when the cancer cells have to spread to form secondary colonies the prognosis for the patient is worse If meaningful improvements in survival are to occur then control of metastasis will be a foundation Relatively little is known about the control of the metastatic process at the molecular level This volume begins to explore our current

knowledge regarding the underlying molecular and biochemical mechanisms controlling the metastatic phenotype While all of the authors attempted to put their findings into a context for translation to the clinical situation the state of the art does not fully allow this Nonetheless we write these summaries of our work as an early effort toward that end I am grateful to all of the authors who have contributed generously of their time and energies to make this volume a reality To metastasize neoplastic cells dissociate from the primary tumor enter a circulatory compartment typically lymphatics or blood vasculature survive transport arrest exit the circulation and finally proliferate at a discontinuous site in response to local growth factors Unless cells accomplish every step of the metastatic cascade metastases cannot develop The process is highly inefficient i e
