Seeds Of Repression:

Seeds of Repression Athan G. Theoharis, 1977 *Perilous Times* Geoffrey R. Stone, 2004 Geoffrey Stone's *Perilous Times* incisively investigates how the First Amendment and other civil liberties have been compromised in America during wartime. Stone delineates the consistent suppression of free speech in six historical periods from the Sedition Act of 1798 to the Vietnam War and ends with a coda that examines the state of civil liberties in the Bush era. Full of fresh legal and historical insight, *Perilous Times* magisterially presents a dramatic cast of characters who influenced the course of history over a two hundred year period from the presidents Adams, Lincoln, Wilson, Roosevelt and Nixon to the Supreme Court justices Taney, Holmes, Brandeis, Black and Warren to the resisters Clement Vallandigham, Emma Goldman, Fred Korematsu and David Dellinger. Filled with dozens of rare photographs, posters and historical illustrations, *Perilous Times* is resonant in its call for a new approach in our response to grave crises. *Seeds of Repression; Harry S. Truman and the Origins of McCarthyism* Athan G. Theoharis, 1971 **Embryogenesis** Ken-Ichi Sato, 2012-04-20 The book *Embryogenesis* is a compilation of cutting edge views of current trends in modern developmental biology focusing on gametogenesis, fertilization, early and/or late embryogenesis in animals, plants and some other small organisms. Each of 27 chapters contributed from the authorships of world wide 20 countries provides an introduction as well as an in depth review to classical as well as contemporary problems that challenge to understand how living organisms are born, grow and reproduce at the levels from molecule and cell to individual. **The Politics of Racism** Ann Gomer Sunahara, 2020-03-31 *The Politics of Racism: The Uprooting of Japanese Canadians During the Second World War* is the first book to fully document the politics behind the 1942 expulsion order that saw 20,000 Japanese Canadians evicted from their homes in British Columbia and sent inland to work camps, detention centres and farms in Alberta and Manitoba. The book details the relationship between racism and political expediency and shows how political parties and the affairs of the nation were controlled by a small group of politicians who scapegoated minorities to hang on to power. Most alarmingly, *The Politics of Racism* shows how easily Canadians allowed themselves to be manipulated by a political process that used fear and war hysteria in a very cynical and calculated way. Ann Sunahara has used previously classified government documents and the wartime records of the Liberal government to reveal a startling new portrait of political connivance that shows Mackenzie King bowing to the pressures of a small number of B.C. politicians who saw the Japanese problem as a useful tool to enhance their status and win favours in Ottawa. Branded as traitors in the eyes of many of their countrymen, unaware that the military had opposed their uprooting without political friends and allies except for the CCF, the Japanese Canadians were powerless, a muffled minority within a country at war. Ann Sunahara has woven together her analysis of government documents with the personal memories of victims of that shameful period. The accounts of the victims and the official records provide a poignant and powerful indictment of the politicians who used racism and fear to further their own careers and of a society whose indifference let it

happen Since the 1981 version of *The Politics of Racism* POR1981 was published it has undergone two further editions an HTML version in 2000 POR2000 with an additional afterward about Redress and an e book edition POR2020 with an additional photo essay by the author Both are published at japanesecanadianhistory.ca

Gulag Realities Sebastian Farnham, AI, 2025-03-20 *Gulag Realities* explores the Soviet Gulag system a network of forced labor camps and its devastating impact on Soviet society The book examines how a state built on the premise of equality could operate such a brutal system of political repression It delves into the Gulag's role within the Soviet economy highlighting how it was an integral part of resource extraction and heavy industry Furthermore the book investigates the dehumanization process inflicted on prisoners stripping them of their identities and turning them into expendable tools of the state The book argues that the Gulag system was not an aberration but a consequence of Soviet ideology and political practices It reveals the historical and ideological roots of the Gulag tracing its evolution from the Bolshevik Revolution to its peak under Stalin A significant portion of the book explores the daily realities of life within the camps detailing the harsh living conditions and the brutal treatment of political prisoners The book unfolds in a structured manner beginning with the historical context and progressing to the experiences within the camps and the long term impact on Soviet society By drawing upon archival documents memoirs and scholarly analyses *Gulag Realities* offers a comprehensive understanding of the Gulag's structure function and lasting consequences making it valuable for students academics and anyone interested in Soviet history and human rights

Epigenetic Memory and Control in Plants Gideon Grafi, Nir Ohad, 2013-04-18 Epigenetics commonly acts at the chromatin level modulating its structure and consequently its function in gene expression and as such plays a critical role in plant response to internal and external cues This book highlights recent advances in our understanding of epigenetic mechanisms as a major determinant through which internal and external signals such as those occurring during hybridization flowering time reproduction and response to stress communicate with plant cells to bring about activation of multiple nuclear processes and consequently plant growth and development The outcome of these processes may persist for generations long after the initial cues have expired and may contribute to plant evolution

Abiotic Stress Signaling in Plants: Functional Genomic Intervention Girdhar K. Pandey, Manoj Prasad, Amita Pandey, Maik Boehmer, 2016-08-08 Abiotic stresses such as high temperature low temperature drought and salinity limit crop productivity worldwide Understanding plant responses to these stresses is essential for rational engineering of crop plants In *Arabidopsis* the signal transduction pathways for abiotic stresses light several phytohormones and pathogenesis have been elucidated A significant portion of plant genomes *Arabidopsis* and rice were mostly studied encodes for proteins involves in signaling such as receptor sensors kinases phosphatases transcription factors and transporters channels Despite decades of physiological and molecular effort knowledge pertaining to how plants sense and transduce low and high temperature low water availability drought water submergence microgravity and salinity signals is still a major question for plant biologist One major constraint hampering

our understanding of these signal transduction processes in plants has been the lack or slow pace of application of molecular genomic and genetics knowledge in the form of gene function In the post genomic era one of the major challenges is investigation and understanding of multiple genes and gene families regulating a particular physiological and developmental aspect of plant life cycle One of the important physiological processes is regulation of stress response which leads to adaptation or adjustment in response to adverse stimuli With the holistic understanding of the signaling pathways involving not only one gene family but multiple genes or gene families plant biologist can lay a foundation for designing and generating future crops which can withstand the higher degree of environmental stresses especially abiotic stresses which are the major cause of crop loss throughout the world without losing crop yield and productivity Therefore in this e Book we intend to incorporate the contribution from leading plant biologists to elucidate several aspects of stress signaling by functional genomics approaches

Omics in Seed Development: Challenges and Opportunities for Improving of Seed Quality and Yield in Model and Crop Plants Daoquan Xiang, Zhaorong Hu, Raju Datla, 2025-03-06 Seed development represents an important phase of the life cycle in sexually reproducing plant species. A seed is a complex organ system of three components: the embryo that contributes to germline continuity, endosperm for nourishment and the seed coat for protection. The developmental programs and the associated events that culminate in the production of a mature seed are highly complex and require precisely coordinated integration of the genetic, molecular, biochemical, metabolic and physiological pathways and their interactions with environmental cues. Research advances in seed development using model and crop species such as Arabidopsis, rice, maize, wheat and Brassica species have uncovered several key genes and pathways that regulate the cell and tissue specification, differentiation and growth programs. The key findings from these studies are helping to develop a framework for advancing the knowledge and understanding of the process and the underpinning molecular mechanisms of an embryo, endosperm and seed coat development. However, knowledge gaps still exist in understanding the regulating networks and metabolic programs involved in defining several important seed traits associated with seed quality and yield, especially in crop plants. Continued rapid advances in omics technologies have contributed to the development of several critical tools for performing genome, epigenome, transcriptome, proteome and metabolome studies and their applications in seed development. Bioinformatics and computational tools are also playing important contributions in the large-scale genome-wide systems level analysis, modeling and predictions to identify and characterize the underpinning mechanisms that support seed formation. A holistic understanding of the complexities and interactions that drive seed development is becoming increasingly possible with the application of omics tools to decipher gene, protein and metabolite networks. In the proposed Research Topic, we highlight current advances in genomics, proteomics, lipidomics, metabolomics, metagenomics, transcriptomics and phenomics studies of seed development in both model and crop species. We aim to further elucidate how these key genetic regulators and pathway genes act together to control cell division, patterning, differentiation and storage reserve accumulation during seed development, how these critical processes coordinate to define the seed as a whole and how the genetic and regulatory networks function to generate tremendous natural diversity in the size, number and compositional aspects of plant seeds.

Proceedings of the Fourth International Symposium on Seed, Transplant and Stand Establishment of Horticultural Crops Daniel I. Leskovar, 2008 This volume contains 48 papers presented from lectures and posters at the Fourth International Symposium on Seed Transplant and Stand Establishment of Horticultural Crops arranged in eight topical areas: seed

biotechnology and genetics seed germination and vigor seed technology conventional transplant production and technology organic seed transplant production abiotic biotic stress grafting stand establishment and field performance *Annual Plant Reviews, Control of Primary Metabolism in Plants* William Plaxton, Michael T. McManus, 2008-04-15 The ability to control the rates of metabolic processes in response to changes in the internal or external environment is an indispensable attribute of living cells that must have arisen with life's origin. This adaptability is necessary for conserving the stability of the intracellular environment which is in turn essential for maintaining an efficient functional state. The advent of genomics, proteomics and metabolomics has revolutionised the study of plant development and is now having a significant impact on the study of plant metabolism and its control. In the last few years significant advances have been made with the elucidation of enzyme gene families and the identification of new proteinaceous and allosteric regulators. The first part of this volume is devoted to generic aspects of metabolic control with chapters on the key control points in pathways. Part Two considers the control of specific pathways with detailed descriptions including structures and discussions of the regulation of these pathways particularly in terms of the enzymology. The book is directed at researchers and professionals in plant biochemistry, physiology, molecular biology and cell biology. **Annual Plant Reviews, Seed Development, Dormancy and**

Germination Kent Bradford, Hiro Nonogaki, 2008-04-15 The formation, dispersal and germination of seeds are crucial stages in the life cycles of gymnosperm and angiosperm plants. The unique properties of seeds, particularly their tolerance to desiccation, their mobility and their ability to schedule their germination to coincide with times when environmental conditions are favorable to their survival, as seedlings have no doubt contributed significantly to the success of seed-bearing plants. Humans are also dependent upon seeds which constitute the majority of the world's staple foods, e.g. cereals and legumes. Seeds are an excellent system for studying fundamental developmental processes in plant biology as they develop from a single fertilized zygote into an embryo and endosperm in association with the surrounding maternal tissues. As genetic and molecular approaches have become increasingly powerful tools for biological research, seeds have become an attractive system in which to study a wide array of metabolic processes and regulatory systems. *Seed Development, Dormancy and Germination* provides a comprehensive overview of seed biology from the point of view of the developmental and regulatory processes that are involved in the transition from a developing seed through dormancy and into germination and seedling growth. It examines the complexity of the environmental, physiological, molecular and genetic interactions that occur through the life cycle of seeds along with the concepts and approaches used to analyze seed dormancy and germination behavior. It also identifies the current challenges and remaining questions for future research. The book is directed at plant developmental biologists, geneticists, plant breeders, seed biologists and graduate students. **Plant Epigenetics** Nikolaus Rajewsky, Stefan Jurga, Jan Barciszewski, 2017-04-27 This book presents in 26 chapters the status quo in epigenomic profiling. It discusses how functional information can be indirectly inferred and describes the new approaches that promise functional

answers collectively referred to as epigenome editing It highlights the latest important advances in our understanding of the functions of plant epigenomics and new technologies for the study of epigenomic marks and mechanisms in plants Topics include the deposition or removal of chromatin modifications and histone variants the role of epigenetics in development and response to environmental signals natural variation and ecology as well as applications for epigenetics in crop improvement Discussing areas ranging from the complex regulation of stress and heterosis to the precise mechanisms of DNA and histone modifications it presents breakthroughs in our understanding of complex phenotypic phenomena Epigenetic Shaping of Sociosexual Interactions: From Plants to Humans ,2014-08-22 Epigenetic Shaping of Sociosexual Interactions From Plants to Humans is the first attempt to interpret the higher social functions of organisms This volume covers an extraordinarily wide range of biological research and provides a novel framework for understanding human specific brain functions Covers an extraordinarily wide range of biological research Provides a novel framework for understanding human specific brain functions
