**Étude num rique du cisaillement des g omatriaux granulaires coh sifs** Nicolás Estrada Mejía,2008 Ce travail de th se porte

sur la modélisation numérique et l'analyse du cisaillement dans les milieux granulaires cohésifs. Dans le cadre de la méthode de la Dynamique des Contacts nous avons développé un modèle de cohésion qui cherche à imiter la cohésion par cimentation. Ce modèle fait intervenir trois paramètres de résistance au niveau des contacts : une résistance à la traction, un coefficient de frottement au glissement et un coefficient de frottement au roulement, ainsi qu'un critère de création et de rupture des liens cohésifs. Les contacts sont cohésifs au début des simulations et leur rupture entraîne la perte irréversible de la résistance à la traction. Nous avons fait varier les trois paramètres microscopiques et nous avons étudié leur influence dans la résistance au cisaillement, la dilatance et la microstructure du milieu. Nos résultats montrent que le frottement interne et l'adhésion macroscopiques ont des origines microscopiques différentes. Nous observons aussi que la microstructure du milieu cisaillait stationnairement aussi connu comme l'état critique est fortement affecté par l'angle de frottement et la résistance au roulement au niveau des contacts. En particulier, le rôle mécanique du réseau faible change avec ces deux paramètres microscopiques ce qui résulte de la formation d'une nouvelle structure de transmission de forces. D'autre part, nous avons aussi appliqué la méthode de simulation numérique à l'étude d'un processus naturel : les glissements de terrain. Nous avons développé une méthodologie qui tient compte de la morphologie initiale du système de la résistance des grains et d'un mécanisme de déclenchement ce qui permet d'intégrer dans la méthode modélisant les phases d'initiation et de propagation du glissement. Pour illustrer cette méthodologie, nous l'avons appliquée à l'exemple hypothétique d'une avalanche déclenchée par la montée progressive du niveau d'une nappe d'eau.

**Mécanique Des Milieux Granulaires** Jamila Rahmoun, 2010-10

Les propriétés physiques des milieux granulaires trouvent leur origine à l'échelle locale des contacts entre les grains qui influencent le comportement global. Nous développons dans la première partie de ce mémoire une approche continue qui améliore la théorie de Janssen et permet de calculer les contraintes dans les silos. Ensuite, une modélisation du phénomène de crantage est effectuée à partir des simulations numériques discrétisées avec le code MULTICOR. Nous calculons les contraintes moyennes exercées au niveau des parois lors du remplissage d'un silo par un milieu granulaire polydisperse. Une bonne concordance est observée entre les résultats des simulations discrétisées et ceux de l'approche continue développée. Une autre conséquence de l'existence de contacts privilégiés entre les grains est l'anisotropie de texture. Dans la dernière partie, une approche micromécanique qui tient compte de cette anisotropie par l'intermédiaire d'un tenseur de texture d'ordre quatre est proposée et comparée aux simulations numériques discrétisées. Les tendances qualitatives et quantitatives des résultats obtenus sont toutefois satisfaisantes.

**Modélisation micro-mécanique des milieux granulaires partiellement saturés** Luc Scholtès, 2008

La méthode des sols non saturés et plus généralement des milieux granulaires multiphasiques a principalement traité dans le cadre de la théorie des milieux continus. Le comportement de ces matériaux trouvant ses origines à l'échelle des particules nous en proposons une analyse micromécanique basée sur des simulations numériques utilisant la Méthode des Eléments Discrets. Pour les faibles teneurs en eau, l'eau se concentre sous la forme de ponts liquides intergranulaires dont les propriétés en terme de

force et de volume de liquide peuvent être interprétées travers la théorie de la capillarité. En partant de la description des effets microscopiques de la capillarité un modèle discret tridimensionnel a été développé. Les propriétés macroscopiques des milieux granulaires faiblement saturés sont ainsi investiguées aussi bien en terme de résistance d'eau que de résistance au cisaillement au travers d'essais réalisés sur des assemblages de grains numériques. En complément d'analyse les techniques de l'homogénéisation sont mises en oeuvre. Les analyses permettent de mettre en évidence l'importance de la distribution du liquide au sein du milieu ainsi que le caractère tensoriel des contraintes mécaniques associées aux forces capillaires. La texture du liquide est étudiée et l'existence d'une contrainte effective est discutée sur des bases microstructurelles. Finalement une approche est proposée pour simuler l'effondrement au remouillage caractéristique de la transition d'un état partiellement saturé à un état complètement saturé. Micromécanique de la rupture dans les milieux granulaires François Nicot, Richard Wan, 2008-06-01

Comportement mécanique des milieux granulaires sous sollicitations cycliques Frédéric Mayoraz, 2002    Cohésion par capillarité et comportement mécanique de milieux granulaires Fabien Soulié, 2005    Modélisation physique et numérique de la micro-mécanique des milieux granulaires saturés. Application à la stabilité de substrats sédimentaires en génie côtier Emanuele Catalano, 2012 Le comportement des matériaux multiphasiques couvre une multitude de phénomènes qui suscitent un grand intérêt dans le domaine scientifique et professionnel. Les propriétés mécaniques de ces types de matériau trouvent leur origine dans les phases dont ils sont composés : leur distribution et interaction. Un nouveau modèle hydrodynamique couplé est présent dans ce travail de thèse pour appliquer l'analyse de l'hydrodynamique des milieux granulaires saturés. Le modèle associe la méthode des éléments discrets DEM pour la modélisation de la phase solide avec une formulation en volumes finis à l'échelle des pores PFV du problème de l'écoulement. Une importance particulière est donnée à la description de l'interaction entre les phases avec la détermination des forces fluides appliquées sur chacune des particules tout en assurant un coût de calcul abordable qui permet la modélisation de plusieurs milliers de particules en trois dimensions. Le milieu est considéré saturé par un fluide incompressible. Les pores et leur connectivité sont basés sur une triangulation régulière des assemblages. L'analogie de cette formulation avec la théorie classique de Biot est présente. Le modèle est validé par la comparaison des résultats numériques obtenus pour un problème de consolidation d'un sol granulaire avec la solution analytique de Terzaghi. Une approche pour analyser l'hydrodynamique d'un sol granulaire est finalement présente. La reproduction du phénomène de liquation d'un sol est également présente.
