Mathematical Models In Medicine Workshop Mainz March 1976 Lecture Notes In Biomathematics Vol 11:

Mathematical Demography D. Smith, Nathan Keyfitz, 2012-12-06 This volume is an effort to bring together important contributions to the mathematical development of demography and to suggest briefly their historical context We have tried to find who first thought of the several concepts and devices commonly used by demographers what sort of problem he was facing to which the device or concept seemed the solution and how his invention developed subsequently in the hands of others Historically the book starts with a Roman table of life expectancies from the third century a d about which we know little and with John Graunt's explorations in an area that was still popularly suspect when he wrote in 1662 These are followed by the astronomer Halley who looked into the field long enough to invent the life table and to notice that Their Majesties would take a sizeable loss on the annuity scheme they had just launched and by Euler who was first to devise the formulas of stable population theory and to apply them to filling gaps in data To these we add the handful of further contributions in the 19th century and many pieces from the explosion of contributions that began in this century with Lotka We doubt that we have managed to trace everything back to its ultimate beginning and suspect that our nominees in some cases have been anticipated by predecessors who will be turned up by other students

Mathematical Models in Medicine J. Berger, J. Bühler, R. Repges, P. Tautu, 2013-03-13 *Biological Growth and Spread* W. Jäger, H. Rost, P. Tautu, 2013-03-12 These Proceedings have been assembled from papers presented at the Conference on Models of Biological Growth and Spread held at the German Cancer Research Centre Heidelberg and at the Institute of Applied Mathematics of the University of Heidelberg July 16-21 1979 The main theme of the conference was the mathematical representation of biological populations with an underlying spatial structure An important feature of such populations is that they and or their individual components may interact with each other Such interactions may be due to external disturbances internal regulatory factors or a combination of both Many biological phenomena and processes including embryogenesis cell growth chemotaxis cell adhesion carcinogenesis and the spread of an epidemic or of an advantageous gene can be studied in this context Thus problems of particular importance in medicine human and veterinary agriculture ecology etc may be taken into consideration and a deeper insight gained by utilizing more realistic mathematical models Since the intrinsic biological mechanisms may differ considerably from each other a great variety of mathematical approaches theories and techniques is required The aims of the conference were i To provide an overview of the most important biological aspects ii To survey and analyse possible stochastic and deterministic approaches iii To encourage new research by bringing together mathematicians interested in problems of a biological nature and scientists actively engaged in developing mathematical models in biology
