are presented and application oriented references to relevant practical issues are made Necessary mathematical tools are examined and applied to current problems of data analysis such as brand loyalty portfolio selection credit investigation quality control product clustering asset pricing etc mainly in an economic context In addition we discuss interdisciplinary

applications to biology linguistics sociology electrical engineering computer science and artificial intelligence For the models we make use of a wide range of mathematics from basic disciplines of numerical linear algebra statistics and optimization to more specialized game graph and even complexity theories By doing so we cover all relevant techniques commonly used in Big Data Analytics Each chapter starts with a concrete practical problem whose primary aim is to motivate the study of a particular Big Data Analytics technique Next mathematical results follow including important definitions auxiliary statements and conclusions arising Case studies help to deepen the acquired knowledge by applying it in an interdisciplinary context Exercises serve to improve understanding of the underlying theory Complete solutions for exercises can be consulted by the interested reader at the end of the textbook for some which have to be solved numerically we provide descriptions of algorithms in Python code as supplementary material This textbook has been recommended and developed for university courses in Germany Austria and Switzerland
