Hussein, 2012-03-30 Search and Classification Using Multiple Autonomous Vehicles provides a comprehensive study of decision making strategies for domain search and object classification using multiple autonomous vehicles MAV under both deterministic and probabilistic frameworks It serves as a first discussion of the problem of effective resource allocation using MAV with sensing limitations i e for search and classification missions over large scale domains or when there are far more objects to be found and classified than there are autonomous vehicles available Under such scenarios search and classification compete for limited sensing resources This is because search requires vehicle mobility while classification restricts the vehicles to the vicinity of any objects found The authors develop decision making strategies to choose between these competing tasks and vehicle motion control laws to achieve the proposed management scheme Deterministic Lyapunov based probabilistic

Bayesian based and risk based decision making strategies and sensor management schemes are created in sequence Modeling and analysis include rigorous mathematical proofs of the proposed theorems and the practical consideration of limited sensing resources and observation costs A survey of the well developed coverage control problem is also provided as a foundation of search algorithms within the overall decision making strategies Applications in both underwater sampling and space situational awareness are investigated in detail The control strategies proposed in each chapter are followed by illustrative simulation results and analysis Academic researchers and graduate students from aerospace robotics mechanical or electrical engineering backgrounds interested in multi agent coordination and control in detection and estimation or in Bayes filtration will find this text of interest *Technical Abstract Bulletin* , *Scalable Uncertainty Management* Eyke Hüllermeier, Sebastian Link, Thomas Fober, Bernhard Seeger, 2012-09-11 This book constitutes the refereed proceedings of the 6th International Conference on Scalable Uncertainty Management SUM 2012 held in Marburg Germany in September 2012 The 41 revised full papers and 13 revised short papers were carefully reviewed and selected from 75 submissions The papers cover topics in all areas of managing and reasoning with substantial and complex kinds of uncertain incomplete or inconsistent information including applications in decision support systems machine learning negotiation technologies semantic web applications search engines ontology systems information retrieval natural language processing information extraction image recognition vision systems data and text mining and the consideration of issues such as provenance trust heterogeneity and complexity of data and knowledge **The Mathematical Theory of Information** Jan Kåhre, 2012-12-06 The general concept of information is here for the first time defined mathematically by adding one single axiom to the probability theory This Mathematical Theory of Information is explored in fourteen chapters 1 Information can be measured in different units in anything from bits to dollars We will here argue that any measure is acceptable if it does not violate the Law of Diminishing Information This law is supported by two independent arguments one derived from the Bar Hillel ideal receiver the other is based on Shannon s noisy channel The entropy in the classical information theory is one of the measures conforming to the Law of Diminishing Information but it has however properties such as being symmetric which makes it unsuitable for some applications The measure reliability is found to be a universal information measure 2 For discrete and finite signals the Law of Diminishing Information is defined mathematically using probability theory and matrix algebra 3 The Law of Diminishing Information is used as an axiom to derive essential properties of information Byron s law there is more information in a lie than in gibberish Preservation no information is lost in a reversible channel Etc The Mathematical Theory of Information supports colligation i e the property to bind facts together making two plus two greater than four Colligation is a must when the information carries knowledge or is a base for decisions In such cases reliability is always a useful information measure Entropy does not allow colligation *Subject Guide to Books in Print* , 1993 **Handbook of Asset and Liability Management** Alexandre Adam, 2008-03-11 In the Handbook of Asset and Liability Management From Models

to Optimal Return Strategies Alexandre Adam presents a comprehensive guide to Asset and Liability Management Written from a quantitative perspective with economic explanations this book will appeal to both mathematicians and non mathematicians alike as it gives an operational view on the business Well structured this book includes essential information on Balance Sheet Items and Products Modeling Tools for Asset and Liability Managers as well as Optimal Returns Strategies Explaining in detail all the written and unwritten rules of Asset Liability Management using up to date models and the latest findings the Handbook of Asset and Liability Management is an essential tool for Asset and Liability Managers both for the present day and the future
