The Art of Control Engineering Ken Dutton,Steve Thompson,Bill Barraclough,1997 The Art of Control Engineering provides a refreshingly new and practical treatment of the study of control systems The opening chapters assume no prior knowledge of the subject and are suitable for use in introductory courses The material then progresses smoothly to more advanced topics such as nonlinear systems Kalman filtering robust control multivariable systems and discrete event controllers Taking a practical perspective the text demonstrates how the various techniques fit into the overall picture of control and stresses the ingenuity required in choosing the best tool for each job and deciding how to apply it The most important topics are revisited at appropriate levels throughout the book building up progressively deeper layers of knowledge The Art of Control Engineering is an essential core text for undergraduate degree courses in control electrical and electronic systems and mechanical engineering Its broad practical coverage will also be very useful to postgraduate students and practising engineers

Audiovisual Speech Recognition: Correspondence between Brain and Behavior Nicholas Altieri,2014-07-09 Perceptual processes mediating recognition including the recognition of objects and spoken words is inherently multisensory This is true in spite of the fact that sensory inputs are segregated in early stages of neuro sensory encoding In face to face communication for example auditory information is processed in the

cochlea encoded in auditory sensory nerve and processed in lower cortical areas Eventually these sounds are processed in higher cortical pathways such as the auditory cortex where it is perceived as speech Likewise visual information obtained from observing a talker's articulators is encoded in lower visual pathways Subsequently this information undergoes processing in the visual cortex prior to the extraction of articulatory gestures in higher cortical areas associated with speech and language As language perception unfolds information garnered from visual articulators interacts with language processing in multiple brain regions This occurs via visual projections to auditory language and multisensory brain regions The association of auditory and visual speech signals makes the speech signal a highly configural percept An important direction for the field is thus to provide ways to measure the extent to which visual speech information influences auditory processing and likewise assess how the unisensory components of the signal combine to form a configural integrated percept Numerous behavioral measures such as accuracy e g percent correct susceptibility to the McGurk Effect and reaction time RT have been employed to assess multisensory integration ability in speech perception On the other hand neural based measures such as fMRI EEG and MEG have been employed to examine the locus and or time course of integration The purpose of this Research Topic is to find converging behavioral and neural based assessments of audiovisual integration in speech perception A further aim is to investigate speech recognition ability in normal hearing hearing impaired and aging populations As such the purpose is to obtain neural measures from EEG as well as fMRI that shed light on the neural bases of multisensory processes while connecting them to model based measures of reaction time and accuracy in the behavioral domain In doing so we endeavor to gain a more thorough description of the neural bases and mechanisms underlying integration in higher order processes such as speech and language recognition
