**Pulsed Neural Networks** Wolfgang Maass, Christopher M. Bishop, 2001-01-26 Most practical applications of artificial neural networks are based on a computational model involving the propagation of continuous variables from one processing unit to the next In recent years data from neurobiological experiments have made it increasingly clear that biological neural networks which communicate through pulses use the timing of the pulses to transmit information and perform computation This realization has stimulated significant research on pulsed neural networks including theoretical analyses and model development neurobiological modeling and hardware implementation This book presents the complete spectrum of current research in pulsed neural networks and includes the most important work from many of the key scientists in the field Terrence J Sejnowski s foreword Neural Pulse Coding presents an overview of the topic The first half of the book consists of longer tutorial articles spanning neurobiology theory algorithms and hardware The second half contains a larger number of shorter research chapters that present more advanced concepts The contributors use consistent notation and terminology throughout the book Contributors Peter S Burge Stephen R Deiss Rodney J Douglas John G Elias Wulfram Gerstner Alister Hamilton David Horn Axel Jahnke Richard Kempter Wolfgang Maass Alessandro Mortara Alan F Murray David P M Northmore Irit Opher Kostas A Papathanasiou Michael Recce Barry J P Rising Ulrich Roth Tim Sch nauer Terrence J Sejnowski John Shawe Taylor Max R van Daalen J Leo van Hemmen Philippe Venier Hermann Wagner Adrian M Whatley Anthony M Zador Silicon Implementation of Pulse Coded Neural Networks Mona E. Zaghloul, Jack L. Meador, Robert W. Newcomb, 2012-12-06 When confronted with the hows and whys of nature s computational engines some prefer to focus upon neural function addressing issues of neural system behavior and its relation to natural intelligence Then there are those who prefer the study of the mechanics of neural systems the nuts and bolts of the wetware the neurons and synapses Those who investigate pulse coded implementations of artificial neural networks know what it means to stand at the boundary which lies between these two worlds not just asking why natural neural systems behave as they do but also how they achieve their marvelous feats The research results presented in this book not only address more conventional abstract notions of neural like processing but also the more specific details of neural like processors. It has been established for some time that natural neural systems perform a great deal of information processing via electrochemical pulses Accordingly pulse coded neural network concepts are receiving increased attention in artificial neural network research This increased interest is compounded by continuing advances in the field of VLSI circuit design This is the first time in history in which it is practical to construct networks of neuron like circuits of reasonable complexity that can be applied to real problems We believe that the pioneering work in artificial neural systems presented in this book will lead to further advances that will not only be useful in some practical sense but may also provide some additional insight into the operation of their natural counterparts
