Myasthenia Gravis and Related Disorders

Henry J. Kaminski, 2009-03-02 Advances in the study and understanding of myasthenia gravis have led to the need for the publication of this important new edition. The goal of *Myasthenia Gravis and Related Disorders*, Second Edition, is identical to the first: to provide the clinician and the scientist with a common resource for understanding this complex disorder. This new edition begins with discussions of neuromuscular junction structure and function and follows with updated chapters covering a wide range of topics such as the acetylcholine receptor, clinical presentation, diagnostic evaluation, and treatment. Importantly, new supplemental chapters have been added: these discuss rigorous clinical assessments of patients for research trials and the epidemiology and genetics of myasthenia gravis. The discussion of the most challenging aspects of myasthenia gravis, its impact on patients' psychological makeup, has been expanded as well. *Myasthenia Gravis and Related Disorders*, Second Edition, retains the personal approach of the authors regarding treatment and is a valuable resource for meeting the many and varied needs of patients with myasthenia gravis.

Modern Pupillometry Megan H. Papesch, Stephen D. Goldinger, 2024-05-26 Pupillometry the study of the eyes pupils has a rich history dating back to the 1800s For example to appear dark with desire women once used atropa belladonna deadly nightshade as a cosmetic because the atropine dilated their pupils making them appear more romantically aroused We now know that this relationship is largely driven by the activity of the sympathetic nervous system specifically a small brainstem nucleus known as the locus coeruleus LC Because of tight connections between the musculature of the eyes and LC monitoring the pupils can reveal important insights into brain activity during mental processes Many of these processes are related to attention and arousal cognitive or emotional with the LC controlling mental readiness via secretion of the neurotransmitter norepinephrine While these complicated neurochemical processes happen in the brain they are often overtly observable via pupil dilation Although pupillometry was popular in the 1960s and 1970s it fell out of favor until experiencing a renaissance approximately 10 years ago With the advent of new eye tracking and neural recording technology measuring and analyzing pupil size is now easier than ever Because all modern eye trackers use pupil size in the calculation of gaze location they also provide researchers with moment by moment pupil size measures in output files Although previously considered extra data to support gaze location analyses researchers have begun to conduct eye tracking studies solely to gain access to pupil size data These data have been used to study thought processes in many domains including cognitive science psychopathologies business marketing security contexts and the study of addiction The diversity of interest in pupillometry is matched by the

diversity in approaches taken to data collection analysis and interpretation To date there exists no book or tutorial review devoted specifically to ensuring that researchers carry out rigorous and reproducible work across these varied domains Modern Pupillometry Cognition Neuroscience and Practical Applications fills this gap by exploring the history neuroscience and methodological considerations of pupillometry research within and beyond psychology

Human Factors of Stereoscopic 3D Displays Robert Earl Patterson, Ph.D., 2015-02-18 Human Factors of Stereoscopic Displays provides an overview of all vision relevant topics and issues that inform stereo display design from a user centric or human factor perspective Although both the basic vision science literature and the applied literature will be reviewed the strength and originality of this book comes from the emphasis on the basic science literature on human stereo vision and its implications for stereo display design The reader will learn how to design stereo displays from a human vision human factors perspective Over the past several years there has been a growing interest in the development of high quality displays that present binocular parallax information to

the human visual system for inducing the perception of three dimensional depth The methods for presenting binocular parallax to an observer vary widely and include three broad categories of display stereoscopic holographic and volumetric displays Because the technology for stereoscopic displays is more developed and more widely used than those based on holography or volumetric methods the proposed book addresses those human factors issues involved in the viewing of stereoscopic displays Despite the diverse methods for creating stereoscopic displays which includes stereo spatial multiplexing as well as temporal multiplexing i e field sequential techniques there remain common human factor issues that arise when viewing such displays Human Factors of Stereoscopic Displays will provide a detailed review of these important issues so that they can be considered when designing and using 3D displays In doing so the following topics will be covered interocular cross talk interocular differences in luminance and contrast accommodation vergence mismatch stereoanomaly spatio temporal frequency effects distance scaling of disparity and high level cue conflict body
