Purpose Of Forests:

The Purposes of the National Forests Norman I. Wengert, A. A. Dyer, 1979 **Planted Forests** Julian Evans, 2009

Planted forests despite being only seven per cent of the world's forest resources have superseded naturally regenerating forests as the principal source of industrial wood products. Lessening the pressure for wood production on natural forests, tree planting has released them to be managed for other purposes: carbon sinks, soil and water protection, conservation of biological diversity, recreation and amenity. Representing a complement but not an alternative to natural forests, planted forests have become increasingly important for reducing worldwide deforestation, loss of forest ecosystems and forest degradation. Examining the significance of this rapidly emerging world resource, chapters consider the strengths and weaknesses of planted forests, management objectives for their use and aspects of ownership and policy. Data from key production countries are used to evaluate the implications and sustainability of planted forests as a source of forest products as well as social and ecological issues.

The distribution of powers and responsibilities affecting forests, land use, and REDD+ across levels and sectors in Vietnam: A legal study Le Quang Trung, Vu Tan Phuong, Anastasia Yang, Vo Dai Hai, 2015-10-27

What are the roles and responsibilities of different levels of government over forests and land use in Vietnam? Over the last two decades, how have government priorities shifted? How has decentralisation been realised through changing land laws and forest protection and development programs? Which powers and responsibilities are centralized and which are decentralized? What role do local people play? This report reviews the statutory distribution of powers and responsibilities across levels and sectors. It outlines the legal mandates held by national and lower level governments with regard to land and forest allocation, afforestation programs, rubber plantations, Payments for Forest Environmental Services (PFES), land use planning and more. The review considers legal and policy changes in land use and forestry in Vietnam following the doi moi reform in 1986 up to 2014. After a short introduction, the second section describes the decentralization process, including mechanisms for participation. The third section outlines sources of revenue available to different government levels from forest fees and payments for environmental services. The fourth section details the specific distribution of powers and arenas of responsibility related to multiple land use sectors across and within levels, and the fifth and final section concludes on the policy changes and processes in relation to observed forest cover change. The study was commissioned under CIFOR's Global Comparative Study on REDD as part of a research project on multilevel governance and carbon management at the landscape scale. It is intended as a reference for researchers and policy makers working on land use issues in Vietnam.

The protective functions of forests in a changing climate - European experience Food and Agriculture Organization of the United Nations, 2021-10-13

The objective of this publication is to present the policy and management approach of each member country on its protective forests. The goal of the member countries is to increase the resilience of mountain forests and ensure the sustainability of their protective functions for society. Each country report covers the

following topics 1 definition of protective forests 2 characteristics of the national protective forest system 3 challenges encountered in the management and strengthening of protective forests including climate change impacts 4 governance of the protective forest system and 5 monitoring and planning systems for protective forests Countries have defined characterized and identified challenges inherent to their protective forests and it is through their appropriate governance management and planning that the forests are able to provide ecosystem services in a sustainable way In the context of a changing climate the approach has to be revisited and adapted to novel and increasingly more uncertain conditions This review of reports from 12 countries shows that especially mountain regions in Europe are facing common challenges and that different approaches can be learnt from each another We hope that this report may provide a basis for further actions in transboundary and international cooperation for maintaining and enhancing protective forests

Multi-objective Forest Planning Timo Pukkala, 2013-06-29 Most of the scientific methods devised for forest planning support timber production ignoring the existence of forest functions other than wood production Fortunately the realisation that the forest planning methods available today do not correspond to the needs of today's forestry has activated forest researchers to develop and adopt new methodologies and approaches which are

specifically aimed at multi objective situations This book is about the quantitative approach to multi objective forest planning The emphasis is on topics that are rather new and not yet systematically applied in forest planning practice The topics and methodologies discussed in this book include measurement of preferences multiple criteria decision analysis use of GIS to support multi objective forest management heuristic optimization spatial optimisation and the measurement of non wood forest outputs By reading the book a planning specialist student or a researcher will get an insight into some of the current developments in forest planning research *Use Book, a Manual for Users of the National Forests* United States. Invasive Forest Insects, Introduced Forest Trees, and Altered Ecosystems Timothy D. Paine,2007-05-24 Demand for timber and fibre continues to grow and is being met by increased reliance on plantation forestry Many of the plantations that are being grown around the globe are non native species that have characteristics of rapid growth and good commercial qualities In some cases the high rates of production are a result of the absence of native herbivore and diseases This limited pest status is threatened as pest species move around the globe At the same time there is concern about threats of these non native plantation species on native communities and the impact of changing climates on forest productivity This volume explores many of these issues for the first time Bulletin United States. Singh,2004-10-01 Tropical forests are vital for social economic and ecological reasons They play an important role in ecosystem processes such as the biogeochemical and hydrological cycle they provide habitat for wildlife and serve as source of biodiversity and they offer protection against soil erosion Kremen et al 2000 and Condit et al 2002 The forest contains large trees standing 30 to 50 meters in height creating continuous canopy of foliage The enclosed canopy shades tree forest floor inhibiting the development of much undergrowth creating an open forest formation Piercing into the tree canopy reveals a multistory appearance of broad leaf evergreen vegetation The forest is a treasure trove of different animal and plant species Forest and woodlands cover nearly 40% of the earth s land surface and they are the most biologically diverse ecosystems in most part of the world The tropics consist of a diversity occurring between the latitudes of the tropic of Cancer and the tropics of Capricorn north and south of the equator These ecosystems are currently experiencing the highest rates of destruction in the world More than 90% of dry forests have been destroyed

and less than 2% of what remains is protected Because of the climatic and forest structure dry forests are easier to clear for agriculture the soil is more fertile and the land is more suitable for livestock Forest area has increased slightly since 1980 in industrial countries but has declined by almost 10% in developing countries Tropical deforestation probably exceeds 1 30 000 sq km a year Less than 40% of forest globally are relatively undisturbed by human action Many developing countries today rely on timber for export earnings at the same time millions of people in tropical countries still depend on forests to meet their every need Since time immemorial forest has provided a valuable source of economic life for human populations Yet the ways in which forests are used and valued depends largely on people s economic needs and priorities in a particular place or at a particular time balanced against the relative scarcity or abundance of forest resources Over recent years a complex array of social economic and political changes have altered human demands on forest These changing demands have had devastating impact on forest status and integrity This book is an outcome of the own work experience and research on tropical forest for the last 30 years I hope this will provide to readers concise sufficient and recent information on tropical forest of the world
