symbol of food security Seed is the source of life Seeds are basic in crop production No agricultural practice can improve a crop beyond the limits set by the seed Quality seed is the key for successful agriculture which demands each and every seed should be readily germinable and produce a vigorous seedling ensuring high yield Care with the seed and joy with the harvest and Good seed doesn't cost it always pays are the popular adage which enlightens the importance of the quality seed The farmers always very much interested in the best seed management practices which are safe environmentally sound and scientifically proven technologies Understandably in view of the importance of quality seeds in Agriculture both as a product and as a means of establishing a crop most attention at all levels of investigation has been directed to crop seeds Since seed is a biological entity deterioration beyond harvest is inevitable The consequences of low quality seeds are poor germination low and delayed emergence and weak growth leading to poor field stand and ultimately reflecting on reduced yield Low productivity could be attributed broadly to use of poor quality seeds At present to overcome this several seed enhancement techniques are available for quality upgradation It has two goals one is related to seed designing and other to seed functioning The rationale for pre sowing seed enhancement techniques is to mobilize the seeds own resources and to augment them with external resources to get maximum improvement in field stand establishment and yield To achieve this several physical physiological and biochemical treatments are available at present to give value addition to seeds Physiological seed treatments that improve seed performance are based primarily on seed hydration and dehydration Among several non physiological seed treatments coating or pelleting can also indirectly improve seed germination stand establishment and crop productivity

Microbial Plant Pathogens-Detection and Disease Diagnosis: P.

Narayanasamy,2010-10-26 The need for the development of techniques based on the characteristics of the viral proteins and genomic nucleic acids was realized in order to detect identify differentiate and quantify viruses in the infected plants planting materials with or without symptoms of infection Immunoassays have been successfully applied for the detection of viruses in crop and weed host plant species as well as in the vectors Nucleic acid based techniques have been demonstrated to be the most reliable and sensitive tests for detection identification and differentiation of viruses and viroids present in plants and planting materials Inclusion of numerous protocols in appropriate chapters as appendix is a unique feature of this volume

Testing Methods for Seed-transmitted Viruses Sven Erik Albrechtsen,2006 This book provides a practical guide to the commonly used detection methods for seed transmitted viruses and viroids affecting both tropical and non tropical crops The first part describes important aspects of seed transmitted viral diseases The second and main part contains principles of the detection techniques and step by step protocols accompanied by method optimization and comments Most of the described techniques can be equally applied to plant viruses and viroids other than seedborne ones This book will be of significant interest to those working in seed testing laboratories and students and teachers within plant pathology and seed science

Global Perspectives on the Health of Seeds and Plant Propagation Material Maria Lodovica Gullino, Gary

Munkvold, 2014-10-16 This volume continues the series of books on Plant Pathology in the 21st Century and contains the papers given at the 10th International Congress of Plant Pathology ICPP 2013 held in Beijing August 25-30 2013 concerning seed health. Many pathogens are transmitted throughout infected seeds and propagation material. The fact that propagation material production is very much concentrated in few establishments favors the quick spread of new diseases throughout seed commercialization. This phenomenon is very much accelerated in a globalized system. The book covers case studies of contamination, aspects of detection and diagnosis as well as disease management strategies with special emphasis towards seed treatments with unconventional products. This book will be useful for all plant pathologists as well as students in advanced courses.

Microbial Plant Pathogens Perumal Narayanasamy, 2016-12-08 Healthy seeds and propagules are the basic requirement for producing good grains, fruits and vegetables needed for human survival and perpetuation. Dispersal of microbial plant pathogens via seeds and propagules has assumed more importance than other modes of dispersal as infected seeds and propagules have the potential to become the primary sources of carrying pathogen inoculum for subsequent crops. Several diseases transmitted through seeds and propagules have been shown to have the potential to damage economies as a result of huge quantitative and qualitative losses in numerous crops. Hence it is essential to rapidly detect, identify and differentiate the microbial plant pathogens present in seeds and propagules precisely and reliably using sensitive techniques. *Microbial Plant Pathogens: Detection and Management in Seeds and Propagules* provides a comprehensive resource on seed-borne and propagule-borne pathogens. Information on the biology of microbial pathogens including genetic diversity, infection process and survival mechanisms of pathogens and epidemiology of diseases caused by them are discussed critically and in detail to highlight weak links in the life cycles of the pathogens. Development of effective disease management systems based on the principles of exclusion and eradication of pathogens and immunization of crop plants to enhance the levels of resistance of cultivars to diseases has been effective to keep the pathogens at bay. The need for production of disease-free seeds and propagules has been emphasized to prevent the carryover of the inoculum to the next crop or introduction of the pathogens to other locations. Effectiveness of adopting simple cultural practices and development of cultivars resistant to diseases through traditional breeding methods or biotechnological approach have resulted in reducing the pathogen inoculum and disease incidence. Although application of different chemicals may reduce the disease incidence effectively, biological management of crop diseases employing potential biological control agents have to be preferred to preserve the agroecosystems. Greater efforts have to be made to integrate compatible strategies to enhance the effectiveness of disease management systems. Protocols appended at the end of relevant chapters form a unique feature of this book to enable the researchers to fine-tune their projects. This 2-volume set provides comprehensive and updated information about the economically important groups of microbial plant pathogens carried by seed and propagules. Graduate students, researchers

and teachers of plant pathology plant protection microbiology plant breeding and genetics agriculture and horticulture as well as certification and quarantine personnel will find the information presented in this book useful
