Wecker, 2012-12-06 Influenza continues to be one of the major epidemic diseases of man and is in fact his only remaining pandemic disease BEVERIDGE 1969 This is largely because influenza virus undergoes extreme antigenic variation the mechanism of which is still poorly understood Two kinds of antigenic variation occur in influenza viruses antigenic drift and major antigenic shifts both involve changes in the hemagglutinin and neuraminidase antigens on the surface of the virus Antigenic drift which involves gradual changes in the surface antigens of influenza virus is thought to result from the selection by an immune population of mutant virus particles with altered antigenic determinants These mutants therefore possess a growth advantage in the presence of antibody FRANCIS and MAASSAB 1965 ARCHETTI and HORSFALL 1950 HAMRE et al 1958 It has been shown that antigenic mutants isolated in vitro by selection with antibody have changes in amino acid sequence in the polypeptides of the hemagglutinin subunits LAVER and WEBSTER 1968 and it is likely that antigenic drift in the neuraminidase occurs by the same mechanism

Korn,2012-12-06 Although not the only volume in this series in which lipids are discussed the present volume is devoted entirely to methods for the study of membrane lipids Even now when membrane proteins are properly receiving so much attention this emphasis on membrane lipids is appropriate Essentially all of the phospholipids and sterols of cells are in membranes Moreover although membrane proteins are certainly of utmost importance the more we learn about the functional properties of membrane proteins the more we appreciate the unique features of phospholipids without which biological membranes would be impossible The hydrophobic hydrophilic duality of phospholipids allows indeed requires their association in an aqueous environment into an essentially two dimensional membrane only molecularly thick in one dimension but relatively infinite in the other two a structure composed of small molecules not covalently linked and therefore infinitely mobile and variable but yet a structure with great stability and one largely impermeable to most biomolecules These membrane forming properties are shared by many amphipathic polar lipids phospholipids glycolipids and sphingolipids that differ significantly from each other in the nature of their polar head groups and their fatty acids These variations in structure allow a range of specific interactions among membrane lipids and between lipids and proteins and also provide for membranes of variable but controlled fluidity In this way phospholipids provide an appropriate milieu for functional membrane proteins and also significantly modulate their catalytic activities
