*Methods of Microarray Data Analysis II* Simon M. Lin, Kimberly F. Johnson, 2007-05-08 Microarray technology is a major experimental tool for functional genomic explorations and will continue to be a major tool throughout this decade and beyond The recent explosion of this technology threatens to overwhelm the scientific community with massive quantities of data Because microarray data analysis is an emerging field very few analytical models currently exist *Methods of Microarray Data Analysis II* is the second book in this pioneering series dedicated to this exciting new field In a single reference readers can learn about the most up to date methods ranging from data normalization feature selection and discriminative analysis to machine learning techniques Currently there are no standard procedures for the design and analysis of microarray experiments *Methods of Microarray Data Analysis II* focuses on a single data set using a different method of analysis in each chapter Real examples expose the strengths and weaknesses of each method for a given situation aimed at helping readers choose appropriate protocols and utilize them for their own data set In addition web links are provided to the programs and tools discussed in several chapters This book is an excellent reference not only for academic and industrial researchers but also for core bioinformatics genomics courses in undergraduate and graduate programs

Statistical Techniques for Neuroscientists Young K. Truong, Mechelle M. Lewis, 2016-10-04 *Statistical Techniques for Neuroscientists* introduces new and useful methods for data analysis involving simultaneous recording of neuron or large cluster brain region neuron activity The statistical estimation and tests of hypotheses are based on the likelihood principle derived from stationary point processes and time series Algorithms and software development are given in each chapter to reproduce the computer simulated results described therein The book examines current statistical methods for solving emerging problems in neuroscience These methods have been applied to data involving multichannel neural spike train spike sorting blind source separation functional and effective neural connectivity spatiotemporal modeling and multimodal

neuroimaging techniques The author provides an overview of various methods being applied to specific research areas of neuroscience emphasizing statistical principles and their software The book includes examples and experimental data so that readers can understand the principles and master the methods The first part of the book deals with the traditional multivariate time series analysis applied to the context of multichannel spike trains and fMRI using respectively the probability structures or likelihood associated with time to fire and discrete Fourier transforms DFT of point processes The second part introduces a relatively new form of statistical spatiotemporal modeling for fMRI and EEG data analysis In addition to neural scientists and statisticians anyone wishing to employ intense computing methods to extract important features and information directly from data rather than relying heavily on models built on leading cases such as linear regression or Gaussian processes will find this book extremely helpful
