Self-Healing Methods

Hollow Tube Method

Capillaries or fibers are imbedded in a composite material. The resulting porous network is filled with monomer. When damage occurs, the tubes crack and the monomer is released into cracks. Other tubes containing a hardening agent also crack and mix with the monomer, causing the crack to be healed.

Microcapsule Method

Monomer is encapsulated and embedded within the thermosetting polymer. When a crack reaches the microcapsule, the capsule breaks and the monomer enters the crack, where it can polymerize and mend the crack

Material Design

Reactivity

· reactivity of the catalyst must be maintained even after it is encapsulated

Viscosity

 monomer must flow at a sufficient rate and have appropriate viscosity to cover the entire crack before it is polymerized

Kinetics

 catalyst must quickly dissolve into monomer in order to react efficiently and prevent the crack from spreading further
