The Number Sense : How the Mind Creates Mathematics Stanislas Dehaene Research Affiliate Institut National de la Sante et de la Recherche Medicale,1997-11-06 Our understanding of how the human brain performs mathematical calculations is far from complete But in recent years there have been many exciting scientific discoveries some aided by new imaging techniques which allow us for the first time to watch the living mind at work and others by ingenious experiments conducted by researchers all over the world There are still perplexing mysteries how for instance do idiot savants perform almost miraculous mathematical feats but the picture is growing steadily clearer In *The Number Sense* Stanislas Dehaene offers general readers a first look at these recent stunning discoveries in an enlightening exploration of the mathematical mind Dehaene a mathematician turned cognitive neuropsychologist begins with the eye opening discovery that animals including rats pigeons raccoons and chimpanzees can perform simple mathematical calculations and he describes ingenious experiments that show that human infants also have a rudimentary number sense American scientist Karen Wynn for instance using just a few Mickey Mouse toys and a small puppet theater proved that five month old infants already have the ability to add and subtract Further Dehaene suggests that this rudimentary number sense is as basic to the way the brain understands the world as our perception of color or of objects in space and like these other abilities our number sense is wired into the brain But how then did the brain leap from this basic number ability to trigonometry calculus and beyond Dehaene shows that it was the invention of symbolic systems of numerals that started us on the climb to higher mathematics and in a marvelous chapter he traces the history of numbers from early times when people indicated a number by pointing to a part of their body even today in many societies in New Guinea the word for six is wrist to early abstract numbers such as Roman numerals chosen for the ease with which they could be carved into wooden sticks to modern numbers On our way we also discover many fascinating facts for example because Chinese names for numbers are so short Chinese people can remember up to nine or ten digits at a time English speaking people can only remember seven Dehaene also explores the unique abilities of idiot savants and mathematical geniuses asking what might explain their special mathematical talent And we meet people whose minute brain lesions render their mathematical ability useless one man in fact who is certain that two and two is three Using modern imaging techniques PET scans and MRI Dehaene reveals exactly where in the brain numerical calculation takes place But perhaps most important *The Number Sense* reaches many provocative conclusions that will intrigue anyone interested in mathematics or the mind Dehaene argues for instance that many of the difficulties that children face when learning math and which may turn into a full blown adult innumeracy stem from the architecture of our primate brain which has not evolved for the purpose of doing mathematics He also shows why the human brain does not work like a computer and that the physical world is not based on mathematics rather mathematics evolved to explain the physical world the way that the eye evolved to provide sight A truly fascinating look at the crossroads where numbers and neurons intersect

Mathematics, Physics And Psychology Mark Burgin, Marek Czachor, 2020-11-04 For a long time all thought there was only one geometry Euclidean geometry Nevertheless in the 19th century many non Euclidean geometries were discovered It took almost two millennia to do this This was the major mathematical discovery and advancement of the 19th century which changed understanding of mathematics and the work of mathematicians providing innovative insights and tools for mathematical research and applications of mathematics A similar event happened in arithmetic in the 20th century Even longer than with geometry all thought there was only one conventional arithmetic of natural numbers the Diophantine arithmetic in which $2 \cdot 2 = 4$ and $1 + 1 = 2$ It is natural to call the conventional arithmetic by the name Diophantine arithmetic due to the important contributions to arithmetic by Diophantus Nevertheless in the 20th century many non Diophantine arithmetics were discovered in some of which $2 \cdot 2 = 5$ or $1 + 1 = 3$ It took more than two millennia to do this This discovery has even more implications than the discovery of new geometries because all people use arithmetic This book provides a detailed exposition of the theory of non Diophantine arithmetics and its various applications Reading this book the reader will see that on the one hand non Diophantine arithmetics continue the ancient tradition of operating with numbers while on the other hand they introduce extremely original and innovative ideas

Masters of Mathematics Robert A. Nowlan, 2017-05-13 The original title for this work was Mathematical Literacy What Is It and Why You Need it The current title reflects that there can be no real learning in any subject unless questions of who what when where why and how are raised in the minds of the learners The book is not a mathematical text and there are no assigned exercises or exams It is written for reasonably intelligent and curious individuals both those who value mathematics aware of its many important applications and others who have been inappropriately exposed to mathematics leading to indifference to the subject fear and even loathing These feelings are all consequences of meaningless presentations drill rote learning and being lost as the purpose of what is being studied Mathematics education needs a radical reform There is more than one way to accomplish this Here the author presents his approach of wrapping mathematical ideas in a story To learn one first must develop an interest in a problem and the curiosity to find how masters of mathematics have solved them What is necessary to be mathematically literate It is not about solving algebraic equations or even making a geometric proof These are valuable skills but not evidence of literacy We often seek answers but learning to

ask pertinent questions is the road to mathematical literacy Here is the good news new mathematical ideas have a way of finding applications This is known as the unreasonable effectiveness of mathematics The New York Times Book of Mathematics Gina Kolata,2013-06-04 From the archives of the worlds most famous newspaper comes a collection of its very best writing on mathematics Big and informative The New York Times Book of Mathematics gathers more than 110 articles written from 1892 to 2010 that cover statistics coincidences chaos theory famous problems cryptography computers and many other topics Edited by Pulitzer Prize finalist and senior Times writer Gina Kolata and featuring renowned contributors such as James Gleick William L Laurence Malcolm W Browne George Johnson and John Markoff its a must have for any math and science enthusiast *The Bloomsbury Handbook of Montessori Education* Angela Murray,Eva-Maria Tebano Ahlquist,Maria McKenna,Mira Debs,2023-03-09 Maria Montessori 1870 1952 was an Italian physician anthropologist and educator known around the world for her educational philosophy and pedagogy Her work established educational environments tailored to the child where autonomy and independence are encouraged within thriving and respectful communities The Bloomsbury Handbook of Montessori Education is an accessible resource tracing Montessori education from its historical roots to current scholarship and contemporary issues of culture social justice and environmentalism Divided into six sections the handbook encompasses a range of topics related to Maria Montessori and Montessori education including foundations and evolution of the field key writings pedagogy across the lifespan scholarly research global reach and contemporary considerations such as gender inclusive education race and multilingualism Written by scholars and practitioners based in over 20 countries this is the go to reference work for anyone interested in Montessori education
