Bismuth, Lead, and Tin Tellurides, 1965 A total of 699 references are included to journal articles and reports dealing with properties of bismuth lead and tin tellurides The references are arranged by subject Author and report number indexes are included **TID.**, 1965 *Journal of the Institute of Metals* Institute of Metals, 1964 **Modern Crystallography III** A.A. Chernov, 2012-12-06 Early in this century the newly discovered x ray diffraction by crystals made a complete change in crystallography and in the whole science of the atomic structure of matter thus giving a new impetus to the development of solid state physics Crystallographic methods primarily x ray diffraction analysis penetrated into materials sciences molecular physics and chemistry and also into many other branches of science Later electron and neutron diffraction structure analyses became important since they not only complement x ray data but also supply new information on the atomic and the real structure of crystals Electron microscopy and other modern methods of investigating matter optical electronic paramagnetic nuclear magnetic and other resonance techniques yield a large amount of information on the atomic electronic and real crystal structures Crystal physics has also undergone vigorous development Many remarkable phenomena have been discovered in crystals and then found various practical applications Other important factors promoting the development of crystallography were the elaboration of the theory of crystal growth which brought crystallography closer to thermodynamics and physical chemistry and the development of the various methods of growing synthetic crystals dictated by practical needs Man made crystals became increasingly important for physical investigations and they rapidly invaded technology The production of synthetic crystals made a tremendous impact on the traditional branches the mechanical treatment of materials precision instrument making and the jewelry industry **The Vitreous State** Ivan S. Gutzow, Jörn Schmelzer, 2013-11-11 The present book is devoted to problems of a physically important state of condensed matter the vitreous state We tried to summarize here the experimental evidence and the different theoretical approaches structural thermodynamic and those of statistical physics connected with the formation the kinetic stability and with the general nature of glasses as a particular physical state In addition a summary is given on the information available concerning processes of nucleation and crystallization of glass forming systems on methods of preventing or in contrast catalyzing crystallization in vitrifying liquids on the kinetics of nucleation the modes of crystal growth in undercooled melts and the devitrification of glasses It was our aim to summarize in the present volume the basic principles and the most significant developments of a newly emerging science glass science and to show that at least in principle any substance can exist in the vitreous state Moreover we have tried to demonstrate that the characteristic properties of the vitreous state may be attributed under certain conditions not only to systems with an amorphous structure like the common glasses but also to a number of other states of condensed matter including the crystalline one **Metallurgical Abstracts** Institute of Metals, 1964 *Soviet Physics, Solid State*, 1976 Finishing Abstracts, 1965 **Index to CSIR Publications, 1945-1968** South African Council
