Abstract

Background: Graduate students in medical fields must learn about epidemiology and data analysis to conduct their research. R is a software environment used to develop and run packages for statistical analysis; it can be challenging for students to learn because of compatibility with their computers and problems with package installations. Jupyter Notebook was used to run R, which enhanced the graduate students' ability to learn epidemiological data analysis by providing an interactive and collaborative environment that allows for more efficient and effective learning.

Objective: This study collected class reflections from students and their lecturer in the class "Longitudinal Data Analysis Using R," identified problems that occurred, and illustrated how Jupyter Notebook can solve those problems.

Methods: The researcher analyzed issues encountered in the previous class and devised solutions using Jupyter Notebook. These solutions were then implemented and applied to a new group of students. Reflections from the students were regularly collected and documented in an electronic form. The comments were then thematically analyzed and compared to those of the prior cohort.

Results: Improvements that were identified included the ease of using Jupyter R for data analysis without needing to install packages, increased student questioning due to curiosity, and students having the ability to immediately use all code functions. After using Jupyter Notebook, the lecturer could stimulate interest more effectively and challenge students. Furthermore, they highlighted that students responded to questions. The student feedback shows that learning R with Jupyter Notebook was effective in stimulating their interest. Based on the feedback received, it can be inferred that using Jupyter Notebook to learn R is an effective approach for equipping students with an all-encompassing comprehension of longitudinal data analysis.

Conclusions: The use of Jupyter Notebook can improve graduate students' learning experience for epidemiological data analysis by providing an interactive and collaborative environment that is not affected by compatibility issues with different operating systems and computers.

Introduction

All graduate students in medical fields must eventually learn about epidemiology. Graduate students also study essential

subjects, such as research methodology and data analysis, to conduct and complete the research projects that are part of their degree requirements [1]. Studying R in an epidemiology course can help students develop important skills for data analysis,

Medical Research A Statistical Epidemiological Approach:

Medical Research John M. England, 1975 **Epidemiology** Rodolfo Saracci, 2010-02-25 What is epidemiology What are the causes of a new disease How can pandemics be prevented Epidemiology is the study of the changing patterns of disease and its main aim is to improve the health of populations It is a vital field central to the health of society to the identification of causes of disease and to their management and prevention Epidemiology has had an impact on many areas of medicine from discovering the relationship between tobacco smoking and lung cancer to the origin and spread of new epidemics However it is often poorly understood largely due to misrepresentations in the media In this Very Short Introduction Rodolfo Saracci dispels some of the myths surrounding the study of epidemiology He provides a general explanation of the principles behind clinical trials and explains the nature of basic statistics concerning disease He also looks at the ethical and political issues related to obtaining and using information concerning patients and trials involving placebos ABOUT THE SERIES The Very Short Introductions series from Oxford University Press contains hundreds of titles in almost every subject area These pocket sized books are the perfect way to get ahead in a new subject quickly Our expert authors combine facts analysis perspective new ideas and enthusiasm to make interesting and challenging topics highly readable *Epidemiological Methods in Life Course Research* Andrew Pickles, Barbara Maughan, Michael Wadsworth, 2007-06-28 Life course epidemiology is concerned with the origins of risk resilience and the processes of ageing and how this information can be of value in a public health context particularly for preventive health care Its challenge is to discover develop and analyse sources of data that cover many years of life especially the early developmental period when it is thought some fundamental aspects of lifetime health begin It also analyses genetic propensity and environmental exposures The rapid development of life course epidemiology in parallel with new work on developmental biology and the biology of ageing has brought innovative and ingenious methods of data collection These require new methodological techniques for the design of observational and quasi experimental studies of life course pathways to adult health This book describes these developments together with arguments for improving the measurement of the social environment and its role in developing individual vulnerability or adaptation The development of bio bank large scale population studies for the investigation of genetic effects is discussed alongside the challenges this creates for the epidemiologist The changing design of studies increasing flow of longitudinal data management of data analytic challenges timing and both traditional and more recent methods of managing these features in the study of causality are discussed Life course epidemiology has an essential role in developing methods to evaluate precisely the impact of interacting developmental environmental and genetic effects knowledge of which is fundamental for the design of effective prevention strategies in public health as well as for the advancement of understanding in the broader spheres of health and medicine *Epidemiological Approaches to the Study of Cancer and Other Chronic Diseases* William Haenszel, 1966

Modern Epidemiologic Principles and Concepts Laurens Holmes, Jr, 2025-03-04 Modern Epidemiologic Principles

Concepts Study Design Conduct and Application We often conceive epidemiology in either simplistic or complex terms and neither of these is accurate To illustrate this the complexities in epidemiology could be achieved by considering a study to determine the correlation between serum lipid profile as total cholesterol HDL LDL triglyceride and total body fatness or obesity measured by BMI in children Two laboratories measured serum lipid profiles and one observed a correlation with BMI while the other did not Which is the reliable finding To address this question one needs to examine the context of blood drawing since fasting blood level may provide a better indicator of serum lipid Epidemiologic studies could be easily derailed given the inability to identify and address possible confounding Therefore understanding the principles and concepts used in epidemiologic studies designed and conducted to answer clinical research questions facilitates accurate and reliable findings in these areas Another similar example in a health fair setting involves geography and health termed health geography The risk of dying in one zip code A was 59.5 per 100 000 and in the other zip code B was 35.4 per 100 000 There is a common sense and non epidemiologic tendency to conclude that there is an increased risk of dying in zip code A To arrive at such inference one must first find out the age distribution of these two zip codes since advancing age is associated with increased mortality Indeed zip code A is comparable to the United States population while zip code B is the Mexican population These two examples are indicative of the need to understand epidemiologic concepts such as confounding by age or effect measure modification prior to undertaking clinical research This textbook describes the basics of research in medical and clinical settings as well as the concepts and application of epidemiologic designs in research Design transcends statistical techniques and no matter how sophisticated statistical modeling errors of design sampling cannot be corrected The author of this textbook has presented a complex field in a very simplified and reader friendly manner with the intent that such a presentation will facilitate the understanding of the design process and epidemiologic thinking in clinical research Additionally this book provides a very basic explanation of how to examine the data collected for research conduct for the possibility of confounders and how to address such confounders thus disentangling such effects for reliable and valid inference Research is presented as an exercise around measurement with measurement error inevitable in its conduct hence the inherent uncertainties of all findings in clinical and medical research Modern Epidemiologic Principles and Concepts for Clinicians covers research conceptualization namely research objectives questions hypothesis design implementation data collection analysis results and interpretation While the primary focus of epidemiology is to assess the relationship between exposure risk or predisposing factor and outcome disease or health related event the causal association is presented in a simplified manner including the role of quantitative evidence synthesis QES in causal inference Epidemiology has evolved over the past three decades resulting in several fields being developed This text presents in brief the perspectives and future of epidemiology in the era of the molecular basis of medicine big data 3Ts and systems science Epidemiologic evidence is more reliable if conceptualized and conducted within the context of translational transdisciplinary and team science With

molecular epidemiology we are better equipped with tools to identify molecular biologic indicators of risk as well as biologic alterations in the early stages of disease and with 3 Ts and systems science we are more capable of providing accurate and reliable inference on causality and outcomes research Further the author argues that unless sampling error and confounding are identified and addressed clinical research findings will remain largely inconsistent implying an inconsequential epidemiologic approach Appropriate knowledge of research conceptualization design and statistical inference is essential for conducting clinical and biomedical research This knowledge is acquired through the understanding of epidemiologic observational non experimental and experimental designs and the choice of the appropriate test statistic for statistical inference However regardless of how sophisticated the statistical technique employed for statistical inference is study conceptualization and design are the building blocks of valid scientific evidence Since clinical research is performed to improve patients care it remains relevant to assess not only the statistical significance but the clinical and biologic importance of the findings for clinical decision making in the care of an individual patient Therefore the aim of this book is to provide clinicians biomedical researchers graduate students in research methodology students of public health and all those involved in clinical biomedical research with a simplified but concise overview of the principles and practice of epidemiology In addition the author stresses common flaws in the conduct analysis and interpretation of epidemiologic studies Valid and reliable scientific research is that which considers the following elements in arriving at the truth from the data namely biological relevance clinical importance and statistical stability and precision statistical inference based on the p value and the 90 95 and 99 percent confidence interval The interpretation of results of new research must rely on factual association or effect and the alternative explanation namely systematic error random error precision confounding and effect measure modifier Therefore unless these perspectives are disentangled the results from any given research cannot be considered reliable However even with this disentanglement all study findings remain inconclusive with some degree of uncertainty This book presents a comprehensive guide on how to conduct clinical and medical research mainly research question formulation study implementation hypothesis testing using appropriate test statistics to analyze the data and results interpretation In so doing it attempts to illustrate the basic concepts used in study conceptualization epidemiologic design and appropriate test statistics for statistical inference from the data Therefore though statistical inference is emphasized throughout the presentation in this text equal emphasis is placed on clinical relevance or importance and biological relevance in the interpretation of the study results Specifically this book describes in basic terms and concepts how to conduct clinical and medical research using epidemiologic designs The author presents epidemiology as the main profession in the trans disciplinary approach to the understanding of complex ecologic models of disease and health Clinicians even those without preliminary or infantile knowledge of epidemiologic designs could benefit immensely from what when where who and how studies are conceptualized data collected as planned with the scale of measurement of the outcome and independent

variables data edited cleaned and processed prior to analysis appropriate analysis based on statistical assumptions and rationale results tabulation for scientific appraisal results interpretation and inference Unlike most epidemiologic texts this is the first book that attempts to simplify complex epidemiologic methods for users of epidemiologic research namely clinicians and allied health researchers Additionally it is rare to find a book with integrates of basic research methodology into epidemiologic designs Finally research innovation and the current challenges of epidemiology are presented in this book to reflect the currency of the materials and the approach as well as the responses to the challenges of epidemiology today namely big data accountability and policy A study could be statistically significant but biologically and clinically irrelevant since the statistical stability of a study does not rule out bias and confounding The p value is deemphasized while the use of effect size or magnitude and confidence intervals in the interpretation of results for application in clinical decision making is recommended The use of p value could lead to an erroneous interpretation of the effectiveness of treatment For example studies with large sample sizes and very little or insignificant effects of no clinical importance may be statistically significant while studies with small samples though a large magnitude of effects are labeled negative result Such results are due to low statistical power and increasing variability hence the inability to pass the arbitrary litmus test of the 5 percent significance level Epidemiology Conceptualized Epidemiologic investigation and practice are as old as the history of modern medicine It dates back to Hippocrates circa 2 400 years ago In recommending the appropriate practice of medicine Hippocrates appealed to the physicians ability to understand the role of environmental factors in predisposition to disease and health in the community During the Middle Ages and the Renaissance epidemiologic principles continued to influence the practice of medicine as demonstrated in *De Morbis Artificum* 1713 by Ramazzini and the works on scrotal cancer in relation to chimney sweeps by Percival Pott in 1775 With the works of John Snow a British physician 1854 on cholera mortality in London the era of scientific epidemiology began By examining the distribution pattern of mortality and cholera in London Snow postulated that cholera was caused by contaminated water Epidemiology Today Epigenomic Epidemiology There are several definitions of epidemiology but a practical definition is necessary for the understanding of this science and art Epidemiology is the basic science of public health The objective of this profession is to assess the distribution and determinants of disease disabilities injuries natural disasters tsunamis hurricanes tornados and earthquakes and health related events at the population level Epidemiologic investigation or research focuses on a specific population The basic issue is to assess the groups of people at higher risk women children men pregnant women teenagers whites African Americans Hispanics Asians poor affluent gay lesbians married single older individuals etc Epidemiology also examines how the frequency of the disease or the event of interest changes over time In addition epidemiology examines the variation of the disease of interest from place to place Simply descriptive epidemiology attempts to address the distribution of disease with respect to who when and where For example cancer epidemiologists attempt to describe the occurrence of prostate cancer by observing the differences in

populations by age socioeconomic status occupation geographic locale race ethnicity etc Epidemiology also attempts to address the association between the disease and exposure For example why are some men at high risk for prostate cancer Does race ethnicity increase the risk for prostate cancer Simply is the association causal or spurious This process involves the effort to determine whether a factor exposure is associated with the disease outcome In the example of prostate cancer such exposure includes a high fat diet race ethnicity advancing age pesticides family history of prostate cancer and so on Whether or not the association is factual or a result of chance remains the focus of epidemiologic research The questions to be raised are as follows Is prostate cancer associated with pesticides Does pesticide cause prostate cancer Epidemiology often goes beyond disease exposure association or relationship to establish a causal association In this process of causal inference it depends on certain criteria one of which is the strength or magnitude of association leading to the recommendation of preventive measures However complete knowledge of the causal mechanism is not necessary prior to preventive measures for disease control Further findings from epidemiologic research facilitate the prioritization of health issues and the development and implementation of intervention programs for disease control and health promotion Epidemiology today reflects the application of gene and environment interaction in disease causation morbidity prognosis survival and mortality in subpopulation health outcomes The knowledge and understanding of subpopulation differentials in DNA methylation of specific genes and histone modification allows for the application of abnormal transcriptomes impaired gene expression protein synthesis dysfunctionality and abnormal cellular functionality This book is conceptually organized into three sections Section I deals with research methods section II epidemiologic designs as well as causal inference and perspectives in epidemiology while section III delves into perspectives epidemiologic challenges and special topics in epidemiology namely epidemiologic tree challenges emerging fields the consequentialist perspective of epidemiology and epidemiologic role in health and healthcare policy formulation as well as epigenomic epidemiology and epigenomic determinants of health EDH Throughout this book attempts are made to describe the research methods and non experimental as well as experimental designs Section I comprises research methods with an attempt to describe the following Research objectives and purposes Research questions Hypothesis statements null and alternative Rationales for research clinical reasoning and diagnostic tests as well as Study conceptualization and conduct research question data collection data management hypothesis testing data analysis Section II comprises the epidemiologic study designs with an attempt to describe the basic notion of epidemiology and the designs used in clinical research The notion of epidemiology and the measures of disease occurrence and frequency and the measure of disease association Ecologic and cross sectional designs Case control studies Cohort studies prospective retrospective and am bidirectional Clinical trials or experimental designs and Quantitative evidence synthesis QES systematic review scientific study appraisal and causal inference Section III consists of perspectives challenges and special topics in epidemiology to illustrate the purposive role of epidemiology in

facilitating the goal of public health mainly disease control and health promotion Additionally this section presents the integrative dimension of epidemiology as well as novel epidemiology as epigenomic epidemiology Epidemiologic perspectives advances challenges emerging fields and the future Consequentialism epidemiology and Role of epidemiology in health and healthcare policy formulation Specifically this section addresses the gene and environment interaction in disease causation prognosis and survival Significantly section I chapters deals with the basic descriptions of scientific research at the clinical and population levels and how the knowledge gained from the population could be applied to the understanding of individual patients in the future In these two chapters an attempt is made to discuss clinical reasoning and the use of diagnostic tests sensitivity and specificity in clinical decision making The notions numbers needed to treat NNT and numbers needed to harm NNH are discussed later in the chapter on causal inference The last chapter in this section delves into clinical research conceptualization design involving subject recruitment variable ascertainment data collection data management data analysis and the outline of the research proposal In section II epidemiologic principles and methods are presented with the intent to stress the importance of careful design in conducting clinical and biomedical research Epidemiology remains the basic science of clinical medicine and public health that deals with disease disabilities injury and health related events distributions and determinants and the application of this knowledge to the control and prevention of disease disabilities injuries and related health events at the population level Depending on the research question and whether or not the outcome disease or event of interest has occurred prior to the commencement of the study or if the investigator assigns subjects to treatment or control an appropriate design is selected for the clinical research The measures of effects or point estimates are discussed with concrete examples to illustrate the application of epidemiologic principles in arriving at a reliable and valid result Designs are illustrated with flow charts figures and boxes for distinctions and similarities The hierarchy of study design is demonstrated with randomized clinical trials RCT and the associated Meta Analysis and quantitative evidence synthesis as the design that yields the most reliable and valid evidence from data Though RCTs are considered the gold standard of clinical research it is sometimes not feasible to use this design because of ethical considerations hence the alternative need for prospective cohort design Interpreting research findings is equally as essential as conducting the study itself Interpretation of research findings must be informative and constructive in order to identify future research needs A research result cannot be considered valid unless we disentangle the role of bias and confounding from a statistically significant finding as a result can be statistically significant and yet driven by measurement selection and information bias as well as confounding While my background in basic medical sciences and clinical medicine internal medicine allows me to appreciate the importance of biologic and clinical relevance in the interpretation of research findings biostatisticians without similar training must look beyond random variation p value and confidence interval in the interpretation and utilization of clinical research findings Therefore quantifying the random error with a p value a meaningful

null hypothesis with a strong case against the null hypothesis requires the use of a significance level without a confidence interval deprives the reader of the ability to assess the clinical importance of the range of values in the interval Using Fisher's arbitrary p value cutoff point for type I error alpha level tolerance a p value of 0.05 need not provide strong evidence against the null hypothesis but p less than 0.0001 does i The precise p value should be presented without reference to arbitrary thresholds Therefore results of clinical and biomedical research should not be presented as significant or non significant but should be interpreted in the context of the type of study and other available evidence Secondly systematic error and confounding should always be considered for findings with low p values as well as the potential for effect measure modifiers if any in the explanation of the results Neyman and Pearson describe their accurate observation No test based upon a theory of probability can by itself provide any valuable evidence of the truth or falsehood of a hypothesis But we may look at the purpose of tests from another viewpoint Without hoping to know whether each separate hypothesis is true or false we may search for rules to govern our behavior with regard to them in following which we ensure that in the long run of experience we shall not often be wrong This text is expected to provide practical knowledge to clinicians biomedical researchers and public health scientists implying all researchers use biological and biochemical specimens or samples in an attempt to understand health and disease processes at cellular clinical and population levels Additionally all those who translate such data from bench to clinics in an attempt to improve the health and well being of the patients seen by healthcare providers Further this book describes in basic terms and concepts how to conduct clinical and biomedical research using epidemiologic designs The author presents epidemiology as the main discipline so to speak in the trans disciplinary approach to the understanding of complex ecologic models of disease and health Clinicians even those without preliminary or infantile knowledge of epidemiologic designs could benefit immensely from what when where who and how studies are conceptualized data collected as planned with the scale of measurement of the outcome and independent variables data edited cleaned and processed prior to analysis appropriate analysis based on statistical assumptions and rationale results tabulation for scientific appraisal results interpretation and inference Unlike most epidemiologic texts this is one of the few books that attempts to simplify complex epidemiologic methods for users of epidemiologic research namely clinicians Additionally it is extremely rare to access a book with an integration of basic research methodology into epidemiologic designs Finally research innovation and the current challenges of epidemiology are presented in this book to reflect the currency of the materials and the approach Epidemiologic Methods Thomas D. Cancer Epidemiology Isabel dos Santos Silva,International Agency for Research on Cancer,1999 A basic textbook addressed to medical and public health students clinicians health

professionals and all others seeking to understand the principles and methods used in cancer epidemiology Written by a prominent epidemiologist and experienced teacher at the London School of Hygiene and Tropical Medicine the text aims to help readers become competent in the use of basic epidemiological tools and capable of exercising critical judgment when assessing results reported by others Throughout the text a lively writing style and numerous illustrative examples often using real research data facilitate an easy understanding of basic concepts and methods Information ranges from an entertaining account of the origins of epidemiology through advice on how to overcome some of the limitations of survival analysis to a checklist of questions to ask when considering sources of bias Although statistical concepts and formulae are presented the emphasis is consistently on the interpretation of the data rather than on the actual calculations The text has 18 chapters The first six introduce the basic principles of epidemiology and statistics Chapters 7-13 deal in more depth with each of the study designs and interpretation of their findings Two chapters concerned with the problems of confounding and study size cover more complex statistical concepts and are included for advanced study A chapter on methodological issues in cancer prevention gives examples of epidemiology's contribution to primary prevention screening and other activities for early detection and tertiary prevention The concluding chapters review the role of cancer registries and discuss practical considerations that should be taken into account in the design planning and conduct of any type of epidemiological research

Spatial Analysis in Health Geography Pavlos Kanaroglou, Eric Delmelle, 2016-03-09 Presenting current research on spatial epidemiology this book covers topics such as exposure chronic disease infectious disease accessibility to health care settings and new methods in Geographical Information Science and Systems For epidemiologists and for the management and administration of health care settings it is critical to understand the spatial dynamics of disease For instance it is crucial that hospital administrators develop an understanding of the flow of patients over time especially during an outbreak of a particular disease so they can plan for appropriate levels of staffing and to carry out adaptive prevention measures Furthermore understanding where and why a disease occurs at a certain geographic location is vital for decision makers to formulate policy to increase the accessibility to health services either by prevention or adding new facilities Spatial epidemiology relies increasingly on new methodologies such as clustering algorithms visualization and space time modelling the domain of Geographic Information Science Implementation of those techniques appears at an increasing pace in commercial Geographic Information Systems alongside more traditional techniques that are already part of such systems This book provides the latest methods in GI Science and their use in health related problems

Epidemiology of Cerebrovascular Disease John F. Kurtzke, 2012-12-06 This work started out quite modestly as an investigation into the geographic distribution of cerebrovascular disease But one question soon led to another and it just grewed like Topsy In fact it is hard to characterize precisely what this should be called It is in part a Review of the Literature in part a critique and reworking of other publications and in part a standard view of stroke epidemiology in the more restricted sense of attack

and mortality rates and distribution Still the result would I hope provide a synthesis of the population features of stroke as they appear to me at this time a highly individual interpretation of the state of the art I have studiously avoided any survey of the history of cerebrovascular disease and citations are for those of most recent vintage appropriate to the situation Literature in this field continues to burgeon my references end with the Fall of 1967 When counting noses we must have numbers so the reader will find a massive compilation of tables They are however necessary especially since so many of my statements seem to fly in the face of current orthodoxy whether lay or medical With the data one may decide for himself their validity Insofar as possible tables have been placed in the appendix Unless an author is directly quoted by me all

interpretations of his data are my own and he should be held blameless **The Development of Modern Epidemiology** Walter W Holland, Jørn Olsen, Charles du V. Florey, 2007-04-05 This book marks the 50th anniversary of the foundation of the International Epidemiological Association IEA It is a unique compendium by the world's leading epidemiologists of how the field has developed and how it can be and has been applied to the control of common conditions and threats to public health Five distinct sections guide the reader through the wealth of material Gives an historical account of the concepts and ideas and current importance of epidemiology to global health issues and to organisations such as the WHO Illustrates the advances and contributions to epidemiologic knowledge and the control of disease in specific areas such as cancer cardiovascular disease respiratory disease tuberculosis maternal and child health non biologic disorders such as war and disasters and new infectious diseases Outlines the use of epidemiology in areas such as public health health services occupational and environmental medicine social epidemiology and nutrition Discusses methodological developments such as statistics information sources investigation of disease outbreaks and clinical epidemiology Looks at how the subject has developed internationally with perspectives on regions such as the Americas Poland Spain Eastern Mediterranean New Zealand China Thailand and Japan This remarkable insight into how epidemiology has developed is essential reading for both existing and aspiring epidemiologists

Reviewing **Medical Research A Statistical Epidemiological Approach**: Unlocking the Spellbinding Force of Linguistics

In a fast-paced world fueled by information and interconnectivity, the spellbinding force of linguistics has acquired newfound prominence. Its capacity to evoke emotions, stimulate contemplation, and stimulate metamorphosis is actually astonishing. Within the pages of "**Medical Research A Statistical Epidemiological Approach**," an enthralling opus penned by a very acclaimed wordsmith, readers attempt an immersive expedition to unravel the intricate significance of language and its indelible imprint on our lives. Throughout this assessment, we shall delve into the book's central motifs, appraise its distinctive narrative style, and gauge its overarching influence on the minds of its readers.
