Carovillano, J.F. McClay, H.R. Radoski, 2012-12-06 This monograph is based upon the proceedings of the Summer Institute Physics of the Magnetosphere held on the Boston College campus June 19-28 1967. The program consisted of invited speakers selected by the Editors. An attempt was made to provide comprehensive treatment of all topics of primary relevance to magnetospheric physics but of course some areas received greater coverage than others. The first portion of the conference consisted of tutorial lectures four each by five distinguished scientists and these are presented in Part I of the monograph. The articles appearing in Part I were prepared by the Editors from tapes of the actual lectures. Preliminary manuscripts were prepared and each tutorial lecturer was given the opportunity to make changes or improvements that were incorporated into the final manuscript. H. R. Radoski prepared the lectures of Professor Helliwell, J. F. McClay prepared the lectures of Professor Dessler and the first two of Professor Dungey and the remaining lectures of Professors Dungey, Parker and Van Allen were prepared by me. An effort was made for the most part to write each manuscript in the style of the lectures but the incongruities of spoken English and the number of scribes in the kitchen undoubtedly limited our success. Everyone knows that English is written far better than it is spoken although for some reason the spoken word is more dear.      **Radiation trapped in the earth's magnetic field** O. et al. Dahl, B. Lyons, D.J. Williams, 2013-03-09 The discovery of the earth's radiation belts in 1957 marked the beginning of what is now known as magnetospheric physics. The field has evolved normally from an early discovery phase through a period of exploration and into an era of quantitative studies of the dynamics of magnetized plasmas as they occur in nature. Such environments are common throughout the universe and have been studied in varying detail at the sun, the planets, pulsars and certain radio galaxies. The purpose of this book is to describe basic quantitative aspects of magnetospheric physics. We use selected examples from the earth's magnetosphere to show how theory and data together form a quantitative framework for magnetospheric research. We have tried to organize the material along the philosophy of starting simply and adding complexity only as necessary. We have avoided controversial and relatively new research topics and have tried to use as examples

physical processes generally accepted as important within the earth's magnetospheric system. However, even in some of our examples, the question of whether the physical process applied to a particular problem is the dominant process has yet to be answered.

This report describes a radio investigation of traveling ionospheric disturbances carried out near Boulder, Colorado, over a 1-year period from June 1967 to June 1968. The three-dimensional motions of F2 layer disturbances were measured by the high-frequency Doppler technique with spaced transmitters and at several probing frequencies. Horizontal motions were determined by cross-correlating three signals on frequencies near 5 MHz whose reflection points were approximately at the corners of a horizontal equilateral triangle with 40 km sides. Vertical motions were determined from cross-correlation of signals on frequencies of 3.340 and 5.1 MHz whose reflection points were aligned vertically.
