The Effects of Low Dose Radiation Elena Burlakova, Valeria Naiditch, 2004-08-31 The papers collected in this book show the results of investigations performed by Russian scientists in the field of low dose irradiation action. It is confirmed that low doses do have effects on the human organism and the environment and that the most serious consequences are observed in the far post irradiation period. This branch of radiobiology which developed after the Chernobyl accident and studied its consequences is discussed in detail. The main part of reviews and articles is devoted to the aspects of low dose effects on the human and animal genome and far post irradiation consequences. New details of mechanisms of low dose action are shown and methods of their determination are discussed. Furthermore the adaptive response of organisms and the low dose effects on the immune system are demonstrated. Also the difference between protection mechanisms against low dose irradiation and against high dose irradiation is shown and proved.

Stem cells: From Potential to Promise Khawaja Husnain Haider, 2021-10-04 The book highlights the therapeutic applications of various stem cells and introduces readers to thymus stem cells and their applications in the reconstitution of thymic structure and function. It also discusses the significant role of mesenchymal stem cells (MSCs) in the treatment of autoimmune diseases and the use of MSC derived exosomes in cell free therapy. Moreover it explores the application of hematopoietic stem cells in the vasculoprotection of the ischemically injured heart. Further topics include the regenerative potential of ovarian germline stem cells and the significance of endometrial stem cells in the pathogenesis of female reproductive tract diseases. Lastly the book addresses stem cells from perinatal tissues and their immunoregulatory and differentiation potentials and summarizes new strategies for targeting cancer stem cells to treat tumors.

The Role of Thiol Groups in the Development of Radiation Damage in Thymocytes and Ehrlich Ascites Carcinoma Cells J. F. Scaife, DEFENCE CHEMICAL BIOLOGICAL AND RADIATION LABS OTTAWA (Ont.), 1964 The effect of 800-1000 rads of X irradiation on the thiol contents of thymocytes and Ehrlich ascites carcinoma cells has been compared. Four hours after irradiation there was a decrease in the non protein thiol (NP-SH) content of thymus and thymocytes but no change in ascites cells. In both cells the main NP-SH compound was glutathione. There was no significant effect of irradiation on the protein thiol (P-SH) content of thymus or ascites cells but there was a slight decrease in P-SH in thymocytes after 4 hours incubation. Isolated thymus nuclei showed an immediate small decrease in P-SH content following 800 rads in vitro. Nuclei isolated from rat thymus 1 hour after 1000 rads in vivo showed an increase in the SH content of the globulin fraction and a decrease in the SH content of the nucleohistones. The total SH content of thymocytes and ascites cells was reduced by slow diffusion of H₂O₂ into the cell suspension but no effect of prior irradiation on this decrease of SH was found. Inhibition

of catalase in vivo and in vitro did not produce any of the morphological signs of irradiation damage in thymocytes There was no effect of irradiation on the copper content of thymus thymocytes or ascites cells Author
