**Radioactive Fallout after Nuclear Explosions and Accidents** Y.A. Izrael, 2002-06-20 To achieve successful solutions to the problems resulting from local distant and global radioactive fallout after nuclear explosions and accidents and to achieve successful retrospective analyses of the radiation conditions from recent observations certain information is needed the distribution of the exposure dose rate in the atmosphere and in a country the distribution of radionuclides in natural environments and the nuclide composition of the radioactive fallout the features of formation of the aerosol particle carriers of the radioactivity and of the nuclide distribution of the particles of different sizes formed under different conditions the processes involved in the migration of radioactive products in different zones and environments the external and internal effects of nuclear radiation on human beings This monograph is devoted to a number of these problems namely to studies of the radioactive fallout composition the formation of the aerosol particles that transport the radioactive products and to the analysis of the external radiation doses resulting from nuclear explosions and or accidents Problems of restoration and rehabilitation of contaminated land areas are also touched upon in the monograph To solve such problems one requires knowledge of the mobility of radionuclides an understanding of their uptake by plants their transportation within the food chain and finally their uptake by animal and or human organisms The results of many years of study of radioactive fallout from atmospheric and underground nuclear explosions and accidents are summarized in this book It is intended for various specialists geophysicists ecologists health experts and inspectors as well as those who are concerned with radioactive contamination of natural environments

*Analysis of Environmental Radionuclides* Pavel P. Povinec, 2011-07-28 The purpose of this book is to present a state of art summary of current knowledge of methods of assessment of radionuclides in the terrestrial and marine environments It cover the traditional methods of radioactivity measurements such as radiometrics techniques but also recent developments in the mass spectrometry sector The book starts with a short preface introducing the subject of the book summarising content and philosophy of the book as well as the most important historical achievements The scientific topics are introduced by description of sampling methods optimisation of sampling sites and sampling frequency The recent developments in radiochemical separation methods using chromatography resins for the treatment of actinides transuranics and other groups of radioelements are also described No other book is available covering all aspects of environmental radioactivity measurements although remarkable progress has been made in detection techniques over the last ten years At present the new methods enable to carry out investigations which were not possible before either because of lack of sensitivity or because of the fact that they required too large samples

Superintendent of Documents, 1980 **Energy Research Abstracts**, 1989 *Nuclear Science Abstracts*, 1974 The Pandora Principle Norbert Georg Schwarz, 2019-09-23 Growth is commonly regarded as something positive as something to be rewarded At the same time the growth of the global population and economy leads to depletion of resources violent competition and consequently to the impairment of the quality of life on earth Science has opened innumerable Pandora boxes and humankind has no option but to live with the consequences Once any item of knowledge has entered the world it is practically impossible to remove it from the world We could do away with all weapons of mass destruction but still could not remove the fundamental ability of humans to construct such weapons Progress is always accompanied by destruction Where cities grow nature must give way when a new technology arises it pushes aside older technologies and where one group of humans appropriates resources it deprives another group of humans of them The discovery of fossil fuels as energy resource around 250 years ago has allowed for tremendous growth and progress in a very short time span If the current CO2

emissions continue the atmospheric CO<sub>2</sub> concentrations will reach concentrations that negatively affect cognitive functions within the lifetime of our children and reach lethal concentrations within a few generations Methane is a 25 times more potent greenhouse gas than CO<sub>2</sub> and might apart from human economic activities be released in large amounts from melting permafrost areas of the earth With melting of polar ice shields global warming will accelerate as sun energy that previously was reflected through the albedo effect gets saved in the oceans With depletion of resources we think of resources to keep up our civilisation such as oil and gas However we also have to consider the depletion of resources essential for the pure survival of human beings such as water While human populations grow exponentially ground water levels shrink nearly everywhere If we are not facing near term human extinction we will at least face enormous challenges in the coming years with potential mass dying in some regions of the world most of them probably in poor developing countries of the tropics The creative power of destruction is the destructive power of creation

*Low-Level Environmental Radioactivity* Richard Tykva, Jozef Sabol, 1995-04-13

From the Introduction Low level radioactivity is related to those radioactive sources of ionizing radiation that are characterized by low activities Sometimes activity here does not represent total amount of radionuclides but rather their concentration In other cases the total activity may be quite high but we can measure only a relatively small portion of the material Low may have for different situations and circumstances not only considerably different meanings but also different absolute values as far as the activity or activity concentration is concerned For example one can refer to low activity in the case of radiocarbon dating where the concentration of  $^{14}\text{C}$  is actually lower than its natural concentration and also in the case of radon monitoring where especially in mines or in some enclosed spaces its concentration may be several thousand times higher than the outdoor natural concentrations Emphasis is now being placed on the analysis of naturally occurring radionuclides in the environment or on the release of radionuclides from their different man made sources because liquid and aerial discharge level controls have become more rigorous In addition the applicability of low level methodology increases the extent of different radionuclide applications considerably Since individual radionuclides differ in their decay scheme and particles emitted as well in their energies there is no universal method for the accurate measurement of all radioactive sources Moreover there is usually a mixture of radionuclides in a sample causing some difficulties in a selective evaluation of a given radionuclide Due to the random nature of radioactive disintegrations the appropriate interpretation of the experimental results would be in most cases impossible without elaborate statistical treatment and evaluation of the data obtained Thanks to the availability of computer based instrumentation the measuring data can be in most cases processed and evaluated on line which makes it possible to control and optimize the experiment in order to extract the maximum amount of information carried by the detector response The purpose of this book is to provide an introduction to low level radioactivity assessment and to clarify the nature of its sources as well as the principal methods used in its measurement Our evaluation is concentrated on the present day aspects of low level methodology The book may be useful for all who need highly sensitive analysis of natural or artificial radioactivity both within and outside the nuclear field The attempt of this book

is to summarize the sources of environmental radioactivity and their possible radiological impact in terms of resulting doses to the population and to present a sound review of the measuring methods and techniques for the evaluation of low level radioactivities encountered in both the environment and in a number of applications where radioactive sources are used as a means of obtaining important information
