Trends in Superconductivity Research Paul S. Lewis, 2004

Superconductivity is the ability of certain materials to conduct electrical current with no resistance and extremely low losses High temperature superconductors such as $\text{La}_{2-x}\text{Sr}_x\text{CuO}_x$ T_c 40K and $\text{YBa}_2\text{Cu}_3\text{O}_{7-x}$ T_c 90K were discovered in 1987 and have been actively studied since In spite of an intense world wide research effort during this time a complete understanding of the copper oxide cuprate materials is still lacking Many fundamental questions are unanswered particularly the mechanism by which high T_c superconductivity occurs More broadly the cuprates are in a class of solids with strong electron electron interactions An understanding of such strongly correlated solids is perhaps the major unsolved problem of condensed matter physics with over ten thousand researchers working on this topic High T_c superconductors also have significant potential for applications in technologies ranging from electric power generation and transmission to digital electronics This ability to carry large amounts of current can be applied to electric power devices such as motors and generators and to electricity transmission in power lines For example superconductors can carry as much as 100 times the amount of electricity of ordinary copper or aluminum wires of the same size Many universities research institutes and companies are working to develop high T_c superconductivity applications and considerable progress has been made This new volume brings together new leading edge research in the field

Theory of Unconventional

Superconductors Dirk Manske, 2004-06-25 This book presents a theory for unconventional superconductivity driven by spin excitations Using the Hubbard Hamiltonian and a self-consistent treatment of the spin excitations the interplay between magnetism and superconductivity in various unconventional superconductors is discussed In particular the monograph applies this theory for Cooper pairing due to the exchange of spin fluctuations to the case of singlet pairing in hole and electron doped high T_c superconductors and to triplet pairing in Sr_2RuO_4 Within the framework of a generalized Eliashberg-like treatment calculations of both many normal and superconducting properties as well as elementary excitations are performed The results are related to the phase diagrams of the materials which reflect the interaction between magnetism and superconductivity
