

Sales Forecasting Systems

- Strategic Sales Forecasting Systems usually include several varieties of forecasts: forecasts of sales for the industry as a whole, forecasts of sales for the entire organisation, forecasts of sales for each product or service, forecasts of sales for a new product or service, and forecasts for market segments.
- The results of these sales forecasts are often further categorised by sales territory and sales division. Regardless of type, sales forecasts are usually based on more than historical data; they are not merely projections of past trends.
- Sales forecasts are also based on assumptions about the activities of the competition, government action, shifting customer demand, economic trends, demographic trends, and a variety of other pertinent factors, including even the weather.
- From the sales forecast, tactical decisions regarding the directions of many other organisational functions will flow.

Over the past decade advances in artificial intelligence and computing technologies have provided an alternative way of generating precise and accurate forecasting results for fashion businesses. Despite being an important and timely topic, there is currently an absence of a comprehensive reference source that provides up to date theoretical and applied research findings on the subject of intelligent fashion forecasting systems. This three part handbook fulfills this need and covers materials ranging from introductory studies and technical reviews, theoretical modeling research to intelligent fashion forecasting applications and analysis. This book is suitable for academic researchers, graduate students, senior undergraduate students and practitioners who are interested in the latest research on fashion forecasting.

Information Systems for the Fashion and Apparel Industry Tsan-Ming Jason Choi, 2016-04-13. Information Systems for the Fashion and Apparel Industry brings together trends and developments in fashion information systems, industrial case studies and insights from an international team of authors. The fashion and apparel industry is fast growing and highly influential. Computerized information systems are essential to support fashion business operations and recent developments in social media, mobile commerce, models, radio frequency identification (RFID) technologies and ERP systems are all driving innovative business measures in the industry. After an introductory chapter outlining key decision points and information requirements in fast fashion supply chains, Part One focuses on the principles of fashion information systems with chapters covering how decision making in the apparel supply chains can be improved through the use of fuzzy logic, RFID technologies, evolutionary optimization techniques and artificial neural networks. Part Two then reviews the range of applications for information systems in the fashion and apparel industry to improve customer choice, aid design, implement intelligent forecasting and procurement systems and manage inventory and returns. Provides systematic and comprehensive coverage of information systems for the fashion and apparel industry. Combines recent developments and industrial best practices in apparel supply chain management in order to meet the needs of the fashion and apparel industry professionals and academics. Features input from a team of highly knowledgeable authors with a range of professional and academic experience, overseen by an editor who is a leading expert in the field. Reviews the range of applications for information systems in the fashion and apparel industry to improve customer choice, aid design, implement intelligent forecasting and procurement systems and manage inventory and returns.
