Abstract

We describe two numerical methods applied to the first-order form of the multigroup slab-geometry discrete ordinates equations modelling fixed-source neutron transport problems with anisotropic scattering. The numerical methods described in this article generate the spectrum and a vector basis for the null space of the multigroup slab-geometry discrete ordinates operator defined in a homogeneous domain. The first method is a more general approach of a numerical method described in a recent work by others. We then come to consider numerical and computational aspects of the first method and we propose a second method. The second method is a multigroup extension of a numerical method described in a more recent work by the present author. In order to provide those interested in implementing either method with a reference set, we present numerical results for some multigroup slab-geometry model problems with anisotropic scattering. We conclude this article with a discussion and directions for future work. © 2002 Elsevier Science Ltd. All rights reserved.

Numerical Methods in the Theory of Neutron Transport Guriĭ Ivanovich Marchuk, Viĭacheslav Ivanovich Lebedev, 1986

Neutron Transport Ramadan M. Kuridan, 2023-09-26 This textbook provides a thorough explanation of the physical concepts and presents the general theory of different forms through approximations of the neutron transport processes in nuclear reactors and emphasize the numerical computing methods that lead to the prediction of neutron behavior Detailed derivations and thorough discussions are the prominent features of this book unlike the brevity and conciseness which are the characteristic of most available textbooks on the subject where students find them difficult to follow This conclusion has been reached from the experience gained through decades of teaching The topics covered in this book are suitable for senior undergraduate and graduate students in the fields of nuclear engineering and physics Other engineering and science students may find the construction and methodology of tackling problems as presented in this book appealing from which they can benefit in solving other problems numerically The book provides access to a one dimensional two energy group neutron diffusion program including a user manual examples and test problems for student practice An option of a Matlab user interface is also available

Boundary Value Problems for Transport Equations Valeri Agoshkov, 2012-12-06 In the modern theory of boundary value problems the following approach to investigation is agreed upon we call it the functional approach some functional spaces are chosen the statements of boundary value problems on the basis of these spaces and the solvability of problems are formulated on the basis of the properties of solutions and their dependence on the original data of the problems are analyzed These stages are put on the basis of the correct statement of different problems of mathematical physics or of the definition of ill posed problems For example if the solvability of a problem in the functional spaces chosen cannot be established then probably the reason is in their unsatisfactory choice Then the analysis should be repeated employing other functional spaces Elliptical problems can serve as an example of classical problems which are analyzed by this approach Their investigations brought a number of new notions and results in the theory of Sobolev spaces W_2^k which in turn enabled us to create a sufficiently complete theory of solvability of elliptical equations Nowadays the mathematical theory of radiative transfer problems and kinetic equations is an extensive area of modern mathematical physics It has various applications in astrophysics the theory of nuclear reactors
