

- This inefficient management of water can lead to the twin problems of water logging and salinisation.
- When too much water flows over the land it can become waterlogged, and crops quickly rot and die.
- Salinisation occurs when the natural salts contained in irrigation water seep into the ground and build up in the soil, making it too salty (saline) to grow crops.

In the Indus valley in Pakistan, salinisation is a major problem for farmers. Hot temperatures cause the water in the soil to evaporate. As a result, the salts are left behind and ruin the farmland.

Salinisation of Land and Water Resources Fereidoun Ghassemi,A. J. Jakeman,H. A. Nix,1995 Human induced salinisation is a major threat to the world s land and water resources Inadequate development of irrigation projects inefficient irrigation lack of proper drainage and environmental mismanagement such as the clearing of native vegetation are responsible for the loss of millions of hectares of agricultural and grazing land as well as the misuse of scarce water resources The first part of this book analyses the problem in the context of the world s population its climate and its land and water resources It reviews irrigation methods and crop water requirements the processes of salinisation and its management The second part describes irrigated land dryland and water resource salinity problems in 11 countries which contain approximately 70 per cent of the world s irrigated land In each case study background data environmental conditions and past management practices are given to provide an understanding of why salinity occurs in particular places and of the management methods employed against it Salinisation of Land and Water Resources Fereidoun Ghassemi,A.
