Agency,U. S. Department Security,2013-04-03 This FEMA 154 Report Rapid Visual Screening of Buildings for Potential
Seismic Hazards A Handbook is the first of a two volume publication on a recommended methodology for rapid visual
screening of buildings for potential seismic hazards The technical basis for the methodology including the scoring system and
its development are contained in the companion FEMA 155 report Rapid Visual Screening of Buildings for Potential Seismic
Hazards Supporting Documentation The rapid visual screening procedure RVS has been developed for a broad audience
including building officials and inspectors and government agency and private sector building owners to identify inventory
and rank buildings that are potentially seismically hazardous Although RVS is applicable to all buildings its principal purpose
is to identify 1 older buildings designed and constructed before the adoption of adequate seismic design and detailing
requirements 2 buildings on soft or poor soils or 3 buildings having performance characteristics that negatively influence
their seismic response Once identified as potentially hazardous such buildings should be further evaluated by a design
professional experienced in seismic design to determine if in fact they are seismically hazardous The RVS uses a methodology
based on a sidewalk survey of a building and a Data Collection Form which the person conducting the survey hereafter
referred to as the screener completes based on visual observation of the building from the exterior and if possible the interior
The Data Collection Form includes space for documenting building identification information including its use and size a
photograph of the building sketches and documentation of pertinent data related to seismic performance including the
development of a numeric seismic hazard score Once the decision to conduct rapid visual screening for a community or
group of buildings has been made by the RVS authority the screening effort can be expedited by pre planning including the
training of screeners and careful overall management of the process Completion of the Data Collection Form in the field
begins with identifying the primary structural lateral load resisting system and structural materials of the building Basic
Structural Hazard Scores for various building types are provided on the form and the screener circles the appropriate one
For many buildings viewed only from the exterior this important decision requires the screener to be trained and experienced
in building construction The procedure presented in this Handbook is meant to be the preliminary screening phase of a multi

phase procedure for identifying potentially hazardous buildings Buildings identified by this procedure must be analyzed in more detail by an experienced seismic design professional Because rapid visual screening is designed to be performed from the street with interior inspection not always possible hazardous details will not always be visible and seismically hazardous buildings may not be identified as such Conversely buildings initially identified as potentially hazardous by RVS may prove to be adequate
