Managing Major Hazards The Lebons Of The Moura Mine Disaster:

Managing Major Hazards Andrew Hopkins,2020-07-16 Many organisations live with hazards that have the potential to cause disaster This was the case at Moura underground coal mine in Central Queensland where 11 men died in an explosion in 1994 Andrew Hopkins shows that the explosion was the result of organisational failure and uses it to draw lessons about managing major hazards He argues that there are always tell tale signs of impending disaster and that organisations need to find ways of gathering this information and reacting to it appropriately The Moura story also demonstrates the need to move responsibility for risk management up the corporate hierarchy to ensure that it is not overshadowed by production pressures Otherwise disasters will repeat themselves in horrifyingly similar ways Managing Major Hazards is a gripping story and essential reading for occupational health and safety professionals executives working in hazardous industries policy makers and readers interested in risk management and disaster studies

Managing Major Hazards in Mining ,2005

Improving Self-Escape from Underground Coal Mines National Research Council, Division of Behavioral and Social Sciences and Education, Board on Human-Systems Integration, Committee on Mine Safety: Essential Components of Self-Escape, 2013-06-26 Coal mine disasters in the United States are relatively rare events many of the roughly 50 000 miners underground will never have to evacuate a mine in an emergency during their careers However for those that do the consequences have the potential to be devastating U S mine safety practices have received increased attention in recent years because of the highly publicized coal mine disasters in 2006 and 2010 Investigations have centered on understanding both how to prevent or mitigate emergencies and what capabilities are needed by miners to self escape to a place of safety successfully This report focuses on the latter the preparations for self escape In the wake of 2006 disasters the U S Congress passed the Mine Improvement and New Emergency Response Act of 2006 MINER Act which was designed to strengthen existing mine safety regulations and set forth new measures aimed at improving accident preparedness and emergency response in underground coal mines Since that time the efforts of the National Institute of Occupational Safety and Health NIOSH and the Mine Safety and Health Administration MSHA have contributed to safety improvements in the mining industry However the Upper Big Branch mine explosion in 2010 served as a reminder to remain ever vigilant on improving the prevention of mine disasters and preparations to help miners survive in the event of emergencies This study was set in the context of human systems integration HSI a systems approach that examines the interaction of people tasks and equipment and technology in the pursuit of a goal It recognizes this interaction occurs within and is influenced by the broader environmental context A key premise of human systems integration is that much important information is lost when the various tasks within a system are considered individually or in isolation rather than in interaction with the whole system Improving Self Escape from Underground Coal Mines the task of self escape is part of the mine safety system Anatomy of

REPORT OF THE ROYAL COMMISSION RE BEBAN MINE DISASTER., 1937 The Application of Major Hazard Risk Assessment (MHRA) to Eliminate Multiple Fatality Occurrences in the U.S. Minerals Industry Anthony T. Iannacchione, T. M. Brady, F. Varley, 2008 Major Hazard Risk Assessment MHRA is used to help prevent major hazards e.g. fire

explosion wind blast outbursts spontaneous combustion roof instability and chemical and hazardous substances etc from injuring miners The structured process associated with MHRA helps to characterize the major hazards and evaluate engineering management and work process factors that impact how a mine mitigates its highest risk The National Institute for Occupational Safety and Health NIOSH studied the application of this technique to US mining conditions through a field oriented pilot project Risk assessment teams used in the pilot project were primarily composed of mining company personnel Ten case studies were performed over a wide cross section of mines These mines were representative of the important mining commodities in the US minerals industry i e coal metal non metal and aggregate Also the sizes of the mines ranged from small to large and were located across the country The ten case studies demonstrate that most US mines have the capability to successfully implement an MHRA and that the MHRA methodology produced additional prevention controls and recovery measures to lessen the risk associated with a select population of major mining hazards. The basic ingredient for a successful MHRA is the desire to become more proactive in dealing with the risks associated with events that can cause multiple fatalities A successful outcome is marked by a thorough examination of existing prevention controls and recovery measures When pressed to consider more controls to further mitigate the risk a well staffed risk assessment team was able to identify additional controls For these mining operations it was important to add additional controls even if they were not required by existing mining regulations to lower the risks associated with the major hazards under consideration If a mining operation is not willing to commit its best people to an MHRA or will not provide them with sufficient time to see the process through to its conclusion the MHRA output may prove to be useless Additionally if a mining operation is not prepared to discuss its major hazards in an open and honest fashion and to present the findings of the risk assessment in a written report the MHRA output will be unclear and attempts to monitor or audit important controls may not be possible A MHRA is most effective when the mining operation possesses 1 a proper understanding of its hazards 2 experience with informal and basic formal risk assessment techniques 3 proper facilities machinery and equipment 4 suitable systems and procedures that represent industry Best Practice 5 appropriate organizational support with adequate staff communications and training 6 a formal and thorough plan for emergency response and 7 a safety risk management approach that is promoted and supported at all levels of the organization NIOSHTIC 2 Report on the Cherry Mine Disaster Illinois Bureau Of Statistics, 2013-09 This historic book may have numerous typos and missing text Purchasers can usually download a free scanned copy of the original book without typos from the publisher Not indexed Not illustrated 1910 edition Excerpt to the airshaft continued to be slow and dangerous work impeded as it was by heavy falls of roof By a good deal of hard and dangerous work a small opening was made over under and by the side of the falls in the west passageway to the bottom of the airshaft and through this opening boards were taken and a stopping put in on the north side of the airshaft to prevent any sudden breaking out of fire from that direction Cleaning up and retimbering between the two shafts continued care being taken to keep a close

watch on all stoppings to prevent leaks or a sudden breaking out of fire The body of a man that was known to be lying at the second vein landing at the airshaft was brought to the surface February 14 in a sinking bucket February 5 A large steam pump was sent down the main shaft to the second vein An extra covering of brattice was put around the east and south sides of the bottom of the main shaft at the second vein The concrete was shipped away from around the collar of the airshaft and a float put in and suspended just below the surface ready for carpenters to make permanent repairs to the burned out portion of the airshaft February 6 The west passageway from the main to the airshaft was now cleaned out and securely timbered and open for the passage of pit cars An entry is being driven in the shaft pillar around the north side of the main shaft and the heavy fall of roof on the east bottom to connect again with the shaft bottom on the east side inside of the burned out timbers and fall This entry will give access to the east and northeast sections of the mine and to the airshaft by way of the west passageway Men were cleaning up the main south entry on the west side to recover rails
