Knowledge, Complexity and Innovation Systems Manfred

M. Fischer, Josef Fröhlich, 2013-11-27 In recent years there has been growing scientific interest in the triangular relationship between knowledge complexity and innovation systems The concept of innovation systems carries the idea that innovations do not originate as isolated discrete phenomena but are generated through the interaction of a number of actors or agents This set of actors and interactions possess certain specific characteristics that tend to remain over time Such characteristics are also shared by national regional sectoral and technological interaction systems They can all be represented as sets of institutional actors and interactions whose ultimate goal is the production and diffusion of knowledge The major theoretical and policy problem posed by these systems is that knowledge is generated not only by individuals and organisations but also by the often complex pattern of interaction between them To understand how organisations create new products new production techniques and new organisational forms is important An even more fundamental need is to understand how organisations create new knowledge if this knowledge creation lies in the mobilisation and conversion of tacit knowledge Although much has been written about the importance of knowledge in management little attention has been paid to how knowledge is created and how the knowledge creation process is managed The third component of the research triangle concerns complexity

Globalization and Regional Economic Modeling Russel Cooper, Kieran Donaghy, Geoffrey Hewings, 2007-09-23 Globalization is affecting regional economies in a broad spectrum of aspects from labor market conditions and development policies to climate change To understand better how this works we need both conceptual and methodological contributions We need new schemes to organize our thinking direct our attention and frame thought experiments on the basis of which guidance may be offered And we need methodological innovations that enable us to carry out studies and thought experiments at levels of spatial and temporal resolution and formal complexity adequate to capture and account for the phenomena that characterize globalization The chapters of this volume written by an international cast of eminent regional scientists represent contributions of both types in many cases introducing and demonstrating the use of new tools for analyzing and understanding enormous changes underway in regional economies around the world

Proximity, Distance and Diversity Päivi Oinas, 2017-09-29 Bringing

together a wide range of empirical studies from around the world Sweden Norway Austria Germany France UK Israel Russia China Taiwan Argentina Canada framed in related contemporary theoretical frameworks this book examines the question of the significance of proximate vs more distant relationships for economic agents performance and local economic development While this question has been the subject of intense debates in recent years it is obvious that proximity and distance are not explanatory factors as such The book argues for the need to understand the aims of economic relationships the nature of the regional environment in which they originate and the scale at which they operate The book suggests that the notions of diversity innovativeness maturity and multiple scales should be incorporated into the debates on the significance of proximity for economic performance
