Hybrid Stochastic Systems Tuan A.

Hoang, 2017 This dissertation is concerned with the so called stochastic hybrid systems which are featured by the coexistence of continuous dynamics and discrete events and their interactions Such systems have drawn much needed attentions in recent years One of the main reasons is that such systems can be used to better reflect the reality for a wide range of applications in networked systems communication systems economic systems cyber physical systems and biological and ecological systems among others Our main interest is centered around one class of such hybrid systems known as switching diffusions In such a system in addition to the driving force of a Brownian motion as in a stochastic system represented by a stochastic differential equation SDE there is an additional continuous time switching process that models the environmental changes due to random events In the first part we develop numerical schemes for stochastic differential equations with Markovian switching Markovian switching SDEs By utilizing a special form of Itô's formula for switching SDEs and special structural of the jumps of the switching component we derived a new scheme to simulate switching SDEs in the spirit of Milstein's scheme for purely SDEs We also develop a new approach to establish the convergence of the proposed algorithm that incorporates martingale methods quadratic variations and Markovian stopping times Detailed and delicate analysis is carried out Under suitable conditions which are natural extensions of the classical ones the convergence of the algorithms is established The rate of convergence is also ascertained The second part is concerned with a limit theorem for general stochastic differential equations with Markovian regime switching Given a sequence of stochastic regime switching systems where the discrete switching processes are independent of the state of the systems In the first part we develop numerical schemes for stochastic differential equations with Markovian switching Markovian switching SDEs By utilizing a special form of Itô's formula for switching SDEs and special structural of the jumps of the switching component we derived a new scheme to simulate switching SDEs in the spirit of Milstein's scheme for purely SDEs We also develop a new approach to establish the convergence of the proposed algorithm that incorporates martingale methods quadratic variations and Markovian stopping times Detailed and delicate analysis is carried out Under suitable conditions which are natural extensions of the classical ones the convergence of the algorithms is established The rate of convergence is also ascertained The second part is concerned with a limit theorem for general stochastic differential equations with Markovian regime switching Given a sequence of stochastic regime switching systems where the discrete switching processes are independent of the state of the

systems The continuous state component of these systems are governed by stochastic differential equations with driving processes that are continuous increasing processes and square integrable martingales We establish the convergence of the sequence of systems to the one described by a state independent regime switching diffusion process when the two driving processes converge to the usual time process and the Brownian motion in suitable sense The third part is concerned with controlled hybrid systems that are good approximations to controlled switching diffusion processes In lieu of a Brownian motion noise we use a wide band noise formulation which facilitates the treatment of non Markovian models The wide band noise is one whose spectrum has band width wide enough We work with a basic stationary mixing type process On top of this wide band noise process we allow the system to be subject to random discrete event influence The discrete event process is a continuous time Markov chain with a finite state space Although the state space is finite we assume that the state space is rather large and the Markov chain is irreducible Using a two time scale formulation and assuming the Markov chain also subjects to fast variations using weak convergence and singular perturbation test function method we first proved that the when controlled by nearly optimal and equilibrium controls the state and the corresponding costs of the original systems would converge to those of controlled diffusions systems Using the limit controlled dynamic system as a guidance we construct controls for the original problem and show that the controls so constructed are near optimal and nearly equilibrium
