Smoller, Franco Rongioletti, 2010-09-28 It is a pleasure to introduce this new book *Clinical and Pathological Aspects of Skin Diseases in Endocrine Metabolic Nutritional and Deposition Disease* edited by two of my friends and respected colleagues Franco Rongioletti and Bruce R Smoller In fact I was very enthusiastic when I learned that they were preparing this work Although endocrine metabolic and deposition diseases are regularly included in general textbooks of dermatology and dermatopathology one gains the general impression that these topics receive little emphasis and are mainly included for completeness The prospect of having all of this information in one volume lovingly described and detailed by experts in the field should be of great interest not only to dermatologists pathologists and dermatopathologists but also to internists and endocrinologists who may well gain a different perspective on these disorders As a dermatopathologist I am also pleased that this project has been organized and undertaken by two distinguished authorities in cutaneous pathology This assures a close integration of histology and other laboratory techniques with the clinical aspects of these disorders which will make it possible perhaps for the first time to view these conditions in a truly comprehensive way So I invite you the reader to open this volume and dig in be prepared for an eye catching intellectually stimulating and ultimately rewarding experience Charlottesville VA James W Patterson v w Foreword II Dermatopathology is a bridge between Dermatology and Pathology *Handbook of nutrition and diet in therapy of bone diseases* Ronald Ross Watson, Daruka Mahadevan, 2023-08-07 Many diseases nutrients and foods affect bone structure and bone function and are critical for human health and happiness Osteoporosis is the most common bone metabolic disorder in humans Its incidence is related to poor nutrition altered hormonal status ageing diminished physical activity impaired health status and harmful pharmacotherapy Vitamins especially vitamin D and calcium are historically recognized as important for bone health whereas this book also shows that there is evidence for an association between vitamin D calcium bone mineral density and colorectal cancer In addition calcium supplements may increase the risk for cardiovascular events In regular food patterns milk vegetables herbs fruit and omega 3 may be profitable for bone health Eating disorders also influence bone For example obesity is known to promote bone disease This book discusses the multiple mechanisms by which obesity may affect bone mass and the effect of diet induced maternal obesity on fetal bone development as well as the different nutritional factors that can affect adolescent bone health In addition anorexia nervosa treatments that may help prevent loss of bone mass are reviewed These treatments should not only be geared towards females but also towards males *Nutrition, Health and*

Dietary and Nutritional Indices and Chronic Diseases Sorayya Kheikouri, Mohammad Alizadeh, Masayo Nakamori Rossignoli, 2024-03-06 Chronic diseases such as diabetes cardiovascular diseases and cancers are known as a substantive worldwide challenge for health systems and are major contributors to mortality and morbidity According to the

World Health Organization 71% of all deaths and 63.8 % of Disability Adjusted Life Years DALYs are attributed to chronic diseases. The composition of a diet influences health status and affects the occurrence and severity of chronic diseases. As different components of a diet correlate and interact with one another, addressing only individual dietary constituents does not usually help in analyzing the extent to which diets may prevent or contribute to the development or progress of chronic diseases. In recent years, the concept of dietary indices has received more attention by both researchers and clinicians and is used as a means to capture the overall effect of a diet on a specific disease or a group of related illnesses. These indices are nutritionally derived mathematical algorithms which are developed on the bases of useful or detrimental nutrients and/or food groups. Thus, the indices are frequently used to elucidate proper aspects of a specific diet such as quality, diversity, anti-inflammatory, anti-oxidative and/or anti-glycation potential and acid load. Examples include the dietary inflammatory index, DII, dietary total antioxidant capacity, DTAC, healthy eating index, HEI, dietary acid load, and so forth. There is accumulating evidence indicating a link between scores of dietary and nutritional indices and health outcomes.
