Mathematical Approaches to Software Quality Gerard O'Regan, 2006-08-27 This book provides a comprehensive introduction to various mathematical approaches to achieving high quality software An introduction to mathematics that is essential for sound software engineering is provided as well as a discussion of various mathematical methods that are used both in academia and industry The mathematical approaches considered include Z specification language Vienna Development Methods VDM Irish school of VDM VDM approach of Dijkstra and Hoare classical engineering approach of Parnas Cleanroom approach developed at IBM software reliability and unified modelling language UML Additionally technology transfer of the mathematical methods to industry is considered The book explains the main features of these approaches and applies mathematical methods to solve practical problems Written with both student and professional in mind this book assists the reader in applying mathematical methods to solve practical problems that are relevant to software engineers

Parallel Computer Architectures Arndt Bode, Mario Dal Cin, 2013-12-11 Parallel computer architectures are now going to real applications This fact is demonstrated by the large number of application areas covered in this book see section on applications of parallel computer architectures The applications range from image analysis to quantum mechanics and data bases Still the use of parallel architectures poses serious problems and requires the development of new techniques and tools This book is a collection of best papers presented at the first workshop on two major research activities at the Universitiit Erlangen Niirnberg and Technis che Universitiit Miinchen At both universities more than 100 researchers are working in the field of multiprocessor systems and network configurations and methods and tools for parallel systems Indeed the German Science Founda tion Deutsche Forschungsgemeinschaft has been sponsoring the projects under grant numbers SFB 182 and SFB 342 Research grants in the form of a Sonder forschungsbereich are given to selected German Universities in portions of three years following a thoroughful reviewing process The overall duration of such a research grant is restricted to 12 years The initiative at Erlangen Niirnberg was started in 1987 and has been headed since this time by Prof Dr H Wedekind Work at TU Miinchen began in 1990 head of this initiative is Prof Dr A Bode The authors of this book are grateful to the Deutsche Forschungsgemeinschaft for its continuing support in the field of research on parallel processing The first section of the book is devoted to hardware aspects of parallel systems

of mathematics there are many situations in which calculations were performed incorrectly for important practical applications. Let us look at some examples: the history of computing the number began in Egypt and Babylon about 2000 years BC since then many mathematicians have calculated e.g. Archimedes, Ptolemy, Viete etc. The first formula for computing decimal digits of e was discovered by J. Machin in 1706 who was the first to correctly compute 100 digits of e . Then many people used his method e.g. W. Shanks calculated with 707 digits within 15 years although due to mistakes only the first 527 were correct. For the next examples we can mention the history of computing the fine structure constant that was first discovered by A. Sommerfeld and the mathematical tables, exact solutions and formulas published in many mathematical textbooks were not verified rigorously. These errors could have a large effect on results obtained by engineers. But sometimes the solution of such problems required such technology that was not available at that time. In modern mathematics there exist computers that can perform various mathematical operations for which humans are incapable. Therefore the computers can be used to verify the results obtained by humans to discover new results to prove the results that a human can obtain without any technology. With respect to our example of computing we can mention that recently in 2002 Y. Kanada, Y. Ushiro, H. Kuroda and M. **Boating**, 1967-01

This book *Algebraic Modeling Systems: Modeling and Solving Real World Optimization Problems* deals with the aspects of modeling and solving real world optimization problems in a unique combination. It treats systematically the major algebraic modeling languages AMLs and modeling systems AMLs used to solve mathematical optimization problems. AMLs helped significantly to increase the usage of mathematical optimization in industry. Therefore it is logical consequence that the GOR Gesellschaft für Operations Research Working Group Mathematical Optimization in Real Life had a second meeting devoted to AMLs which after 7 years followed the original 71st Meeting of the GOR Gesellschaft für Operations Research Working Group Mathematical Optimization in Real Life which was held under the title *Modeling Languages in Mathematical Optimization* during April 23-25 2003 in the German Physics Society Conference Building in Bad Honnef, Germany. While the first meeting resulted in the book *Modeling Languages in Mathematical Optimization*, this book is an offspring of the 86th Meeting of the GOR working group which was again held in Bad Honnef under the title *Modeling Languages in Mathematical Optimization*. *Boating*, 1968-01. *Boating*, 1971-01.
