Operations Research/management Science George K. Chacko,1997 *What Every Engineer Should Know About Decision Making Under Uncertainty* John X. Wang,2002-07-01 Covering the prediction of outcomes for engineering decisions through regression analysis this succinct and practical reference presents statistical reasoning and interpretational techniques to aid in the decision making process when faced with engineering problems The author emphasizes the use of spreadsheet simulations and decision trees as important tools in the practical application of decision making analyses and models to improve real world engineering operations He offers insight into the realities of high stakes engineering decision making in the investigative and corporate sectors by optimizing engineering decision variables to maximize payoff

Zaslavsky,2023-10-06 The book comprises original articles on topical issues of risk theory rational decision making statistical decisions and control of stochastic systems The articles are the outcome of a series international projects involving the leading scholars in the field of modern stochastic optimization and decision making The structure of stochastic optimization solvers is described The solvers in general implement stochastic quasi gradient methods for optimization and identification of

complex nonlinear models These models constitute an important methodology for finding optimal decisions under risk and uncertainty While a large part of current approaches towards optimization under uncertainty stems from linear programming LP and often results in large LPs of special structure stochastic quasi gradient methods confront nonlinearities directly without need of linearization This makes them an appropriate tool for solving complex nonlinear problems concurrent optimization and simulation models and equilibrium situations of different types for instance Nash or Stackelberg equilibrium situations The solver finds the equilibrium solution when the optimization model describes the system with several actors The solver is parallelizable performing several simulation threads in parallel It is capable of solving stochastic optimization problems finding stochastic Nash equilibria and of composite stochastic bilevel problems where each level may require the solution of stochastic optimization problem or finding Nash equilibrium Several complex examples with applications to water resources management energy markets pricing of services on social networks are provided In the case of power system regulator makes decision on the final expansion plan considering the strategic behavior of regulated companies and coordinating the interests of different economic entities Such a plan can be an equilibrium a planned decision where a company cannot increase its expected gain unilaterally

Structured Decision Making David R.

Smith, 2020-05-12 Provides and analyzes real examples of how structured decision making SDM can help solve complex

problems involving natural resources When faced with complicated potentially controversial decisions that affect our environment many resource management agencies have come to realize the value of structured decision making SDM the systematic use of principles and tools of decision analysis Few professionals however have extensive experience implementing SDM Structured Decision Making provides key information to both current adopters of the method and those who are deploying it for the first time by demonstrating the formal use of decision analysis to support difficult real world natural resource management decisions Drawing on case studies from multiple public agencies in the United States Canada Australia and Mauritius the editors present an overview of decision analysis a classification of decision types and a catalog of decision analysis methods Dozens of detailed charts and maps help contextualize the material These case studies examine a rich variety of topics including keeping forest birds free from disease conserving imperiled freshwater mussels managing water for oil sands mining dealing with coastal wetlands in the face of sea level rise designing networks for prairie dependent taxa combatting invasive alpine shrubs managing vernal pool habitats for obligate amphibian species and much more Aimed at decision makers tackling natural resource challenges in government agencies around the world as well as advanced undergraduate and graduate students preparing to work in natural resource management Structured Decision Making shows how SDM can be implemented to achieve optimal outcomes that integrate social values and scientific understanding

Decision Making under Uncertainty in Financial Markets Jonas Ekblom, 2018-09-13 This thesis addresses the topic of decision making under uncertainty with particular focus on financial markets The aim of this research is to support improved decisions in practice and related to this to advance our understanding of financial markets Stochastic optimization provides the tools to determine optimal decisions in uncertain environments and the optimality conditions of these models produce insights into how financial markets work To be more concrete a great deal of financial theory is based on optimality conditions derived from stochastic optimization models Therefore an important part of the development of financial theory is

to study stochastic optimization models that step by step better capture the essence of reality This is the motivation behind the focus of this thesis which is to study methods that in relation to prevailing models that underlie financial theory allow additional real world complexities to be properly modeled The overall purpose of this thesis is to develop and evaluate stochastic optimization models that support improved decisions under uncertainty on financial markets The research into stochastic optimization in financial literature has traditionally focused on problem formulations that allow closed form or exact numerical solutions typically through the application of dynamic programming or optimal control The focus in this thesis is on two other optimization methods namely stochastic programming and approximate dynamic programming which open up opportunities to study new classes of financial problems More specifically these optimization methods allow additional and important aspects of many real world problems to be captured This thesis contributes with several insights that are relevant for both financial and stochastic optimization literature First we show that the modeling of several real world aspects traditionally not considered in the literature are important components in a model which supports corporate hedging decisions Specifically we document the importance of modeling term premia a rich asset universe and transaction costs Secondly we provide two methodological contributions to the stochastic programming literature by i highlighting the challenges of realizing improved decisions through more stages in stochastic programming models and ii developing an importance sampling method that can be used to produce high solution quality with few scenarios Finally we design an approximate dynamic programming model that gives close to optimal solutions to the classic and thus far unsolved portfolio choice problem with constant relative risk aversion preferences and transaction costs given many risky assets and a large number of time periods
