Operations Research Proceedings 2008 Bernhard Fleischmann, Karl-Heinz Borgwardt, Robert Klein, Axel Tuma, 2009-08-04 The international conference Operations Research 2008 the annual meeting of the German Operations Research Society GOR was held at the University of Augsburg on September 3-5 2008 About 580 participants from more than 30 countries presented and listened to nearly 400 talks on a broad range of Operations Research The general subject Operations Research and Global Business stresses the important role of Operations Research in improving decisions in the increasingly complex business processes in a global environment The plenary speakers Morris A Cohen Wharton School and Bernd Liepert Executive Board of KUKA Robotics addressed this subject Moreover one of the founders of Operations Research Saul Gass University of Maryland gave the opening speech on the early history of Operations Research This volume contains 93 papers presented at the conference selected by the program committee and the section chairs forming a representative sample of the various subjects dealt with at Operations Research 2008 The volume follows the structure of the conference with 12 sections grouped into six Fields of Applications and six Fields of Methods and Theory This structure in no way means a separation of theory and application which would be detrimental in Operations Research but displays the large spectrum of aspects in the focus of the papers Of course most papers present theory methods and applications together

Operations Research Proceedings, 2004 Networks Of Interacting Machines: Production Organization In Complex Industrial Systems And Biological Cells Dieter Armbruster, Kunihiro Kaneko, Alexander S Mikhailov, 2005-10-12 This review volume is devoted to a discussion of analogies and differences of complex production systems natural as in biological cells or man made as in economic systems or industrial production Taking this unified look at

production is based on two observations Cells and many biological networks are complex production units that have evolved to solve production problems in a reliable and optimal way in a highly stochastic environment On the other hand industrial production is becoming increasingly complex and often hard to predict As a result modeling and control of such production networks involve many different spatial and temporal scales and decision policies for many different structures The common themes of industrial and biological production include evolution and optimization synchronization and self organization robust operation despite high stochasticity and hierarchical dynamics The mathematical techniques used come from dynamical systems theory transport equations control theory pattern formation graph theory discrete event simulations stochastic processes and others The application areas range from semiconductor production to supply chains protein networks slime molds social networks and whole economies

Uncertainty in the Electric Power Industry Christoph Weber, 2006-01-06 Around the world liberalization and privatization in the electricity industry have lead to increased competition among utilities At the same time utilities are now exposed more than ever to risk and uncertainties which they cannot pass on to their customers through price increases as in a regulated environment Especially electricity generating companies have to face volatile wholesale prices fuel price uncertainty limited long term hedging possibilities and huge to a large extent sunk investments In this context **Uncertainty in the Electric Power Industry Methods and Models for Decision Support** aims at an integrative view on the decision problems that power companies have to tackle It systematically examines the uncertainties power companies are facing and develops models to describe them including an innovative approach combining fundamental and finance models for price modeling The optimization of generation and trading portfolios under uncertainty is discussed with particular focus on CHP and is linked to risk management Here the concept of integral earnings at risk is developed to provide a theoretically sound combination of value at risk and profit at risk approaches adapted to real market structures and market liquidity Also methods for supporting long term investment decisions are presented technology assessment based on experience curves and operation simulation for fuel cells and a real options approach with endogenous electricity prices

Revenue Management for Manufacturing Companies Florian Defregger, 2019-01-10 Revenue Management has proven successful in a number of service industries Starting out in the airlines industry in the 1970s Revenue Management spread to tourism sectors such as hotels and cruise ships but also to TV advertising and other industries Revenue Management for the manufacturing sector is a relatively new concept which is explored in this book In order to test if there is a potential for Revenue Management in the manufacturing sector a survey was conducted and sent to a large number of manufacturing companies in the paper steel and aluminium industries The results show that Revenue Management is already partly implemented in these industries but has further greater potential for bottom line improvement in these industries The book continues with a number of mathematical decision models and heuristics for several application scenarios The numerical results of the models indicate that manufacturing companies should seriously consider thinking about implementing a Revenue Management system in order to enhance profits significantly

Memetic Computation Abhishek Gupta, Yew-Soon Ong, 2018-12-18 This book bridges the widening gap between two crucial constituents of computational intelligence the rapidly advancing technologies of machine learning in the digital information age and the relatively slow moving field of general purpose search and optimization algorithms With this in mind the book serves to offer a data driven view of optimization through the framework of memetic computation MC The authors provide a summary of the complete timeline of research activities in MC beginning with the initiation of memes as local search heuristics hybridized with evolutionary algorithms to their modern interpretation as computationally encoded building blocks of problem solving knowledge that can be learned from one task and adaptively transmitted to another In the light of recent research advances the authors emphasize the further development of MC as a simultaneous problem learning and optimization paradigm with the potential to showcase human like problem solving prowess that is by equipping optimization engines to acquire increasing levels of intelligence over time through embedded memes learned independently or via interactions In other words the adaptive utilization of available knowledge memes makes it possible for optimization engines to tailor custom search behaviors on the fly thereby paving the way to general purpose problem solving ability or artificial general intelligence In this regard the book explores some of the latest concepts from the optimization literature including the

sequential transfer of knowledge across problems multitasking and large scale high dimensional search systematically discussing associated algorithmic developments that align with the general theme of memetics The presented ideas are intended to be accessible to a wide audience of scientific researchers engineers students and optimization practitioners who are familiar with the commonly used terminologies of evolutionary computation A full appreciation of the mathematical formalizations and algorithmic contributions requires an elementary background in probability statistics and the concepts of machine learning A prior knowledge of surrogate assisted Bayesian optimization techniques is useful but not essential

Evolutionary Scheduling Keshav Dahal, Kay Chen Tan, Peter I. Cowling, 2007-02-15 Evolutionary scheduling is a vital research domain at the interface of artificial intelligence and operational research This edited book gives an overview of many of the current developments in the large and growing field of evolutionary scheduling It demonstrates the applicability of evolutionary computational techniques to solve scheduling problems not only to small scale test problems but also fully fledged real world problems

Revenue Management with Flexible Products Michael Müller-Bungart, 2007-09-18 Remarkable features of revenue management RM problems in the cargo manufacturing and broadcasting industries are so called flexible products Flexibility means that the actual mode of production is not defined at the time of purchase but can be chosen later on by the service provider This book is among the first to analyze RM problems with flexible products and RM in broadcasting companies The implications of flexibility are explicitly taken into account in the models and methods presented As an aside the book contains descriptions of algorithms to generate stochastic demand data streams for general RM problems An implementation as a Microsoft Windows executable file is available which can directly be used both by theoreticians and practitioners in their own simulation studies This book will be of great value for researchers managers and students interested in RM with flexible products in general and broadcasting companies in particular

Research Trends in Combinatorial Optimization William J. Cook, László Lovász, Jens Vygen, 2008-11-07 The editors and authors dedicate this book to Bernhard Korte on the occasion of his seventieth birthday We the editors are happy about the overwhelming feedback to our initiative to honor him with this book and with a workshop in Bonn on November 3-7 2008

Although this would be a reason to look back we would rather like to look forward and see what are the interesting research directions today This book is written by leading experts in combinatorial optimization All papers were carefully reviewed and eventually twenty three of the invited papers were accepted for this book The breadth of topics is typical for the field combinatorial optimization builds bridges between areas like combinatorics and graph theory submodular functions and matroids network flows and connectivity approximation algorithms and mathematical programming computational geometry and polyhedral combinatorics All these topics are related and they are all addressed in this book Combinatorial optimization is also known for its numerous applications To limit the scope however this book is not primarily about applications although some are mentioned at various places Most papers in this volume are surveys that provide an excellent overview of an

active research area but this book also contains many new results. Highlighting many of the currently most interesting research directions in combinatorial optimization we hope that this book constitutes a good basis for future research in these areas.

Aerial Vehicles T. M. Lam, 2009-01-01 This book contains 35 chapters written by experts in developing techniques for making aerial vehicles more intelligent, more reliable, more flexible in use and safer in operation. It will also serve as an inspiration for further improvement of the design and application of aerial vehicles. The advanced techniques and research described here may also be applicable to other high tech areas such as robotics, avionics, vetronics and space. Introduction to Computational Optimization Models for Production Planning in a Supply Chain Stefan Voß, David L. Woodruff, 2013-06-05 The book begins with an easy to read introduction to the concepts associated with the creation of optimization models for production planning. These concepts are then applied to well known planning models, namely MRP and MRP II. From this foundation, fairly sophisticated models for supply chain management are developed. Another unique feature is that models are developed with an eye toward implementation. In fact, there is a chapter that provides explicit examples of implementation of the basic models using a variety of popular, commercially available modeling languages. **Integrating Routing Decisions in Public**

Transportation Problems Marie E. Schmidt, 2014-01-02 This book treats three planning problems arising in public railway transportation: line planning, timetabling and delay management, with the objective to minimize passengers' travel time. While many optimization approaches simplify these problems by assuming that passengers' route choice is independent of the solution, this book focuses on models which take into account that passengers will adapt their travel route to the implemented planning solution. That is, a planning solution and passengers' routes are determined and evaluated simultaneously. This work is technically deep, with insightful findings regarding complexity and algorithmic approaches to public transportation problems with integrated passenger routing. It is intended for researchers in the fields of mathematics, computer science or operations research working in the field of public transportation from an optimization standpoint. It is also ideal for students who want to gain intuition and experience in doing complexity proofs and designing polynomial time algorithms for network problems. The book models line planning, timetabling and delay management as combined design and routing problems on networks. In a complexity analysis, the border between NP-hard and polynomially solvable problems is illustrated. Based on that, the insights gained are used to develop solution approaches for the considered problems. Besides integer programming formulations, a heuristic method iterating planning and routing step is proposed to solve the problems.
