Recent Developments in Integrable Systems and Riemann-Hilbert Problems

Kenneth T-R McLaughlin, Xin Zhou, 2003 This volume is a collection of papers presented at a special session on integrable systems and Riemann Hilbert problems The goal of the meeting was to foster new research by bringing together experts from different areas Their contributions to the volume provide a useful portrait of the breadth and depth of integrable systems Topics covered include discrete Painleve equations integrable nonlinear partial differential equations random matrix theory Bose Einstein condensation spectral and inverse spectral theory and last passage percolation models In most of these articles the Riemann Hilbert problem approach plays a central role which is powerful both analytically and algebraically The book is intended for graduate students and researchers interested in integrable systems and its applications

From Analytic to Numerical Electromagnetics: Contributions by C. Yeh and his collaborators C.Yeh, F. Shimabukuro, 2018-03-20 Based on properly

organized reprints by C Yeh and his collaborators innovative and original solutions to a number of fundamental problems

essential to the teaching and research in modern electromagnetics are presented in *From Analytic to Numerical Electromagnetics*. The wide range of coverage from general applied theory to the pioneering development of canonical solutions and numerical methods offers a rare in depth understanding of the methods used in solving complex problems in classical and modern electromagnetics. Selected specific examples of solved problems are: New derivation of boundary conditions for scalar wave approximation, completeness of the far zone data, correct power loss calculation, limitations of directional coupler theory, calculation of noise temperature of lossy plate, canonical solutions for elliptic parabolic or spheroidal dielectric structures, waves in periodic medium, focused beam scattering, relativistically moving medium, terahertz low loss waveguides, WDM optical fiber solitons, particle radiation in complex medium, and being the first to develop these numerical methods: FEM, BPM, 4x4 Matrix Method, EBCM, TLM, and 2 Point Boundary Method to solve complex Electromagnetics problems. Readers will find the subjects covered in this book to be a useful supplement to a standard advanced textbook on electromagnetics. To researchers and engineers, *From Analytic to Numerical Electromagnetics* will be a valuable reference and guide to obtain solutions to problems dealing with optical communications, optical solitons, photonics, and terahertz plasmonic metamaterial or nano waveguides.

Supercontinuum Generation in Optical Fibers J. M. Dudley, J. R. Taylor, 2010-04-01. The optical fiber based supercontinuum source has recently become a significant scientific and commercial success with applications ranging from frequency comb production to advanced medical imaging. This one of a kind book explains the theory of fiber supercontinuum broadening, describes the diverse operational regimes, and indicates principal areas of applications, making it a very important guide for researchers and graduate students. With contributions from major figures and groups who have pioneered research in this field, the book describes the historical development of the subject, provides a background to the associated nonlinear optical processes, treats the generation mechanisms from continuous wave to femtosecond pulse pump regimes, and highlights the diverse applications. A full discussion of numerical methods and comprehensive computer code are also provided, enabling readers to confidently predict and model supercontinuum generation characteristics under realistic conditions.

Ultrafast Fiber Switching Devices and Systems Mohammed N. Islam, 1992-08-06. This 1992 book surveys the field of ultrafast fiber switching devices and systems that have potential processing speeds in excess of 50 gigabits per second. The treatment covers basic physical principles, device physics, and systems applications. The purpose of the book is to provide a complete tour of the key research issues and approaches in ultrafast switching. Topics covered include routing and logic devices, solitons in optical fibers, and the application of ultrafast gates to telecommunications transmission systems, local area networks, and optical computing. The author is a member of the Technical Staff in basic research at AT T Bell Laboratories Holmdel and is excellently positioned to provide this state of the art survey in this exciting and advancing field. The book will be of great value to all researchers and graduate students working in the areas of high speed electronics, optical data processing, nonlinear guided wave optics, and photonic switching.

Vertical-Cavity Surface-Emitting Lasers Carl W. Wilmsen, Henryk Temkin, Larry A. Coldren, 2001-11-12 One of the key advances in photonic technology in recent years is the development of vertical cavity surface emitting lasers or VCSELs. These devices have a huge range of potential applications in areas such as communications, printing and optical switching. This book, first published in 1999, provides a clear insight into the physics of VCSELs as well as describing details of their fabrication and applications. All of the book's contributors are at the forefront of VCSEL research and development. Together they provide complete and coherent coverage of the current state of the art. The opening chapters cover VCSEL design, emission from microcavities, growth, fabrication and characterization. These are followed by chapters on long and short wavelength VCSELs, optical data links and free space optical processing. The book will be of great interest to graduate students and researchers in electrical engineering, applied physics and materials science. It will also be an excellent reference volume for practising engineers in the photonics industry. **Progress in Optics**, 1999-06-17 Volume XXXIX presents five review articles dealing with topics of current research interest in optics. The book opens with a chapter dealing with the analytic extension of the concept of geometrical optics rays into the complex domain. The extension is intimately related to inhomogeneous evanescent waves which are currently of particular interest in connection with the rapidly developing area of near field optics. The results are also relevant to investigations of wave attenuation in absorbing media and to the understanding of light penetration into geometrical shadow regions, excitation of surface waves and propagation of Gaussian beams. In this article the principles are presented with special emphasis on the physical significance of complex rays and their applications. Fifth International Conference on Massively Parallel Processing Lennart Johnsson, 1998 This text covers the subjects of computer architecture and parallel and high performance computing. Topics include free space optical interconnect systems design and analysis of optical interconnects, interconnect system analysis and fiber based interconnects.
