 Brambilla,Sara Comai,Maristella Matera,2003-01-04 The most prominent Web applications in use today are data intensive  
 Scores of database management systems across the Internet access and maintain large amounts of structured data for e  
 commerce on line trading banking digital libraries and other high volume sites Developing and maintaining these data  
 intensive applications is an especially complex multi disciplinary activity requiring all the tools and techniques that software  
 engineering can provide This book represents a breakthrough for Web application developers Using hundreds of illustrations  
 and an elegant intuitive modeling language the authors all internationally known database researchers present a  
 methodology that fully exploits the conceptual modeling approach of software engineering from idea to application Readers  
 will learn not only how to harness the design technologies of relational databases for use on the Web but also how to  
 transform their conceptual designs of data intensive Web applications into effective software components A fully self  
 contained introduction and practitioner s guide suitable for both technical and non technical members of staff as well as  
 students A methodology development process and notation WebML based on common practice but optimized for the unique  
 challenges of high volume Web applications Completely platform and product independent even the use of WebML is optional

Software Maintenance - A Management Perspective Phaneendra Nath Vellanky,2007-10-23 Computer systems play an

important role in our society Software drives those systems Massive investments of time and resources are made in developing and implementing these systems Maintenance is inevitable It is hard and costly Considerable resources are required to keep the systems active and dependable We cannot maintain software unless maintainability characters are built into the products and processes There is an urgent need to reinforce software development practices based on quality and reliability principles Though maintenance is a mini development lifecycle it has its own problems Maintenance issues need corresponding tools and techniques to address them Software professionals are key players in maintenance While development is an art and science maintenance is a craft We need to develop maintenance personnel to master this craft Technology impact is very high in systems world today We can no longer conduct business in the way we did before That calls for reengineering systems and software Even reengineered software needs maintenance soon after its implementation We have to take business knowledge procedures and data into the newly reengineered world Software maintenance people can play an important role in this migration process Software technology is moving into global and distributed networking environments Client server systems and object orientation are on their way Massively parallel processing systems and networking resources are changing database services into corporate data warehouses Software engineering environments rapid application development tools are changing the way we used to develop and maintain software Software maintenance is moving from code maintenance to design maintenance even onto specification maintenance Modifications today are made at specification level regenerating the software components testing and integrating them with the system Eventually software maintenance has to manage the evolution and evolutionary characteristics of software systems Software professionals have to maintain not only the software but the momentum of change in systems and software In this study we observe various issues tools and techniques and the emerging trends in software technology with particular reference to maintenance We are not searching for specific solutions We are identifying issues and finding ways to manage them live with them and control their negative impact
