Managing Large Systems:

Managing Large Systems Leonard R. Sayles, 2017-09-29 *Managing Large Systems* examines a range of human organizational and managerial challenges associated with large systems. Special attention is given to the behavioral relationships among scientists and engineers, business and technical managers, sponsor organizations and their contractors, business and government officials, and line and functional managers. The descriptions of problems of technical organization and performance motivation are based primarily on an extended field study of the National Aeronautics and Space Administration. *Managing Large Systems* includes a description of the unique management system developed by NASA under the leadership of James Webb that many believe was responsible for their extraordinary technological achievements that culminated in the first moon landing. Parallels are drawn to other large scale technology programs in aerospace and atomic energy. The authors find traditional managerial principles regarding controls, incentive systems, and planning to be inadequate in the context of large systems. They look to organizational clusters to manage future projects in advanced technological areas and in public sectors such as urban development, massive medical programs, and ecological improvements.

Managing Large Systems Leonard R. Sayles, Margaret K. Chandler, 1997 *High Confidence Software Reuse in Large Systems* Hong Mei, 2008-07-29 *Software reuse* depicts a great vision for the software industry. It has been widely viewed as a promising way to improve both the productivity and quality of software development. However, despite of the successes we have achieved, there are still many issues that have limited the promotion of software reuse in the real world. Therefore, software reuse has remained an important hotspot of research. ICSR is the premier international conference in the field of software reuse. It has been an important venue for presenting advances and improvements within the software reuse domain and a powerful driving force in promoting the interaction between researchers and practitioners. The theme of ICSR 10 was

High Confidence Software Reuse in Large Systems A high confidence system is one that behaves in a well understood and predictable fashion Today s trends towards widespread use of commercial off the shelf COTS technology increased integration continuous evolution and larger scale are yielding more complex software systems So the problem of how to build high confidence complex systems and how to reuse software with a high level of confidence has become a new attractive topic for research Furthermore high level software asset reuse has been a goal for the last 20 30 years and it can still be considered an unsolved question Components based development MDA MDE MDD extreme programming and other techniques or methods are promising approaches to software reuse that still need more research These proceedings report on the current state of the art in software reuse

Yellowstone's Northern Range National Research Council, Division on Earth and Life Studies, Board on Environmental Studies and Toxicology, Committee on Ungulate Management in Yellowstone National Park, 2002-02-01 Ecological Dynamics on Yellowstone's Northern Range discusses the complex management challenges in Yellowstone National Park. Controversy over the National Park Service's approach of natural regulation has heightened in recent years because of changes in vegetation and other ecosystem components in Yellowstone's northern range. Natural regulation minimizes human impacts including management intervention by the National Park Service on the park ecosystem. Many have attributed these changes to increased size of elk and other ungulate herds. This report examines the evidence that increased ungulate populations are responsible for the changes in vegetation and that the changes represent a major and serious change in the Yellowstone ecosystem. According to the authors, any human intervention to protect species such as the aspen and those that depend on them should be prudently localized rather than ecosystem wide. An ecosystem wide approach such as reducing ungulate populations could be more disruptive. The report concludes that although dramatic ecological change does not appear to be imminent, approaches to dealing with potential human caused changes in the ecosystem including those related to climate change should be considered now. The need for research and public education is also compelling.

Theoretical Aspects of Distributed Computing in Sensor Networks Sotiris Nikolettas, José D.P. Rolim, 2011-01-15 Wireless ad hoc sensor networks has recently become a very active research subject. Achieving efficient fault tolerant realizations of very large highly dynamic complex unconventional networks is a real challenge for abstract modelling, algorithmic design and analysis but a solid foundational and theoretical background seems to be lacking. This book presents high quality contributions by leading experts worldwide on the key algorithmic and complexity theoretic aspects of wireless sensor networks. The intended audience includes researchers and graduate students working on sensor networks and the broader areas of wireless networking and distributed computing as well as practitioners in the relevant application areas. The book can also serve as a text for advanced courses and seminars.
