the expertise of leading international authorities to distinguish the issues for which there is a consensus on best practice from those for which the evidence remains inconclusive For example for patients with acute ischemic stroke the first choice is intravenous thrombolytic therapy but does a treatment window of 0 3 hours deliver outcomes significantly better than one of 3 4 5 hours Arterial hypertension is the single most important modifiable risk factor for ischemic stroke but what are the effects of blood pressure reduction among acute stroke patients How effective is blood pressure lowering in primary intracerebral hemorrhage What are the arguments in favour of continuation versus temporary discontinuation of antihypertensive therapy immediately after acute ischemic stroke Endovascular procedures carotid angioplasty stenting are increasingly important but what do the data tell us about their safety Or durability How do they compare with carotid endarterectomy The management of unruptured intracranial aneurysms is rife with controversies clip coil wait and watch The authors examine the evidence for and against Other sections examine the impact of various risk factors and special populations A section on stroke after cardiovascular surgeries reviews the incidence and management of stroke following a whole range of procedures Another examines special risks during pregnancy Lastly the book reviews our understanding of childhood stroke and presents current best practice recommendations for this most challenging group of patients
