Numerical Methods For Bifurcation Problems And Large Scale Dynamical Systems:

Numerical Methods for Bifurcation Problems and Large-Scale Dynamical Systems Eusebius Doedel, Laurette S. Tuckerman, 2000-03-17 *Numerical Continuation Methods for Dynamical Systems* Bernd Krauskopf, Hinke M. Osinga, Jorge Galan-Vioque, 2007-11-06 Path following in combination with boundary value problem solvers has emerged as a continuing and strong influence in the development of dynamical systems theory and its application. It is widely acknowledged that the software package AUTO developed by Eusebius J. Doedel about thirty years ago and further expanded and developed ever since plays a central role in the brief history of numerical continuation. This book has been compiled on the occasion of Eusebius Doedel's 60th birthday. Bringing together for the first time a large amount of material in a single accessible source, it is hoped that the book will become the natural entry point for researchers in diverse disciplines who wish to learn what numerical continuation techniques can achieve. The book opens with a foreword by Herbert B. Keller and lecture notes by Eusebius Doedel himself that introduce the basic concepts of numerical bifurcation analysis. The other chapters by leading experts discuss continuation for various types of systems and objects and showcase examples of how numerical bifurcation analysis can be used in concrete applications. Topics that are treated include interactive continuation tools, higher dimensional continuation, the computation of invariant manifolds and continuation techniques for slow-fast systems, for symmetric Hamiltonian systems, for spatially extended systems and for systems with delay. Three chapters review physical applications: the dynamics of a SQUID, global bifurcations in laser systems and dynamics and bifurcations in electronic circuits.

Numerical Methods for Bifurcation Problems and Large-Scale Dynamical Systems Eusebius Doedel, Laurette S. Tuckerman, 2012-12-06 The Institute for Mathematics and its Applications (IMA) devoted its 1997-1998 program to Emerging Applications of Dynamical Systems. Dynamical systems theory and related numerical algorithms provide powerful tools for studying the solution behavior of differential equations and mappings. In the past 25 years, computational methods have been developed for calculating fixed points, limit cycles and bifurcation points. A remaining challenge is to develop robust methods for calculating more complicated objects such as higher codimension bifurcations of fixed points, periodic orbits and connecting orbits as well as the calculation of invariant manifolds. Another challenge is to extend the applicability of algorithms to the very large systems that result from discretizing partial differential equations. Even the calculation of steady states and their linear stability can be prohibitively expensive for large systems, e.g. 10^3 – 10^6 equations if attempted by simple direct methods. Several of the papers in this volume treat computational methods for low and high dimensional systems and in some cases their incorporation into software packages. A few papers treat fundamental theoretical problems including smooth factorization of matrices, self-organized criticality and unfolding of singular heteroclinic cycles. Other papers treat applications of dynamical systems computations in various scientific fields such as biology, chemical engineering, fluid mechanics and mechanical engineering.

Computational Modelling of Bifurcations and Instabilities in Fluid Dynamics Alexander Gelfgat, 2018-07-06
Instabilities of fluid flows and the associated transitions between different possible flow states provide a fascinating set of problems that have attracted researchers for over a hundred years. This book addresses state-of-the-art developments in numerical techniques for computational modelling of fluid instabilities and related bifurcation structures, as well as providing comprehensive reviews of recently solved challenging problems in the field.

Numerical Continuation and Bifurcation in Nonlinear PDEs Hannes Uecker, 2021-08-19
This book provides a hands-on approach to numerical continuation and bifurcation for nonlinear PDEs in 1D, 2D, and 3D. Partial differential equations (PDEs) are the main tool to describe spatially and temporally extended systems in nature. PDEs usually come with parameters, and the study of the parameter dependence of their solutions is an important task. Letting one parameter vary typically yields a branch of solutions, and at special parameter values, new branches may bifurcate. After a concise review of some analytical background and numerical methods, the author explains the free MATLAB package `pde2path` by using a large variety of examples with demo codes that can be easily adapted to the reader's given problem. Numerical Continuation and Bifurcation in Nonlinear PDEs will appeal to applied mathematicians and scientists from physics, chemistry, biology, and economics interested in the numerical solution of nonlinear PDEs, particularly the parameter dependence of solutions. It can be used as a supplemental text in courses on nonlinear PDEs and modeling and bifurcation.

Introduction to Numerical Continuation Methods Eugene L. Allgower, Kurt Georg, 2003-01-01
Numerical continuation methods have provided important contributions toward the numerical solution of nonlinear systems of equations for many years. The methods may be used not only to compute solutions which might otherwise be hard to obtain, but also to gain insight into qualitative properties of the solutions. *Introduction to Numerical Continuation Methods*, originally published in 1979, was the first book to provide easy access to the numerical aspects of predictor-corrector continuation and piecewise linear continuation methods. Not only do these seemingly distinct

methods share many common features and general principles they can be numerically implemented in similar ways The book also features the piecewise linear approximation of implicitly defined surfaces the algorithms of which are frequently used in computer graphics mesh generation and the evaluation of surface integrals To help potential users of numerical continuation methods create programs adapted to their particular needs this book presents pseudo codes and Fortran codes as illustrations Since it first appeared many specialized packages for treating such varied problems as bifurcation polynomial systems eigenvalues economic equilibria optimization and the approximation of manifolds have been written The original extensive bibliography has been updated in the SIAM Classics edition to include more recent references and several URLs so users can look for codes to suit their needs Audience this book continues to be useful for researchers and graduate students in mathematics sciences engineering economics and business A background in elementary analysis and linear algebra are adequate prerequisites for reading this book some knowledge from a first course in numerical analysis may also be helpful

Bifurcation Analysis of Fluid Flows Henk A. Dijkstra, Fred W. Wubs, 2023-08-24 A better understanding of the mechanisms leading a fluid system to exhibit turbulent behavior is one of the grand challenges of the physical and mathematical sciences Over the last few decades numerical bifurcation methods have been extended and applied to a number of flow problems to identify critical conditions for fluid instabilities to occur This book provides a state of the art account of these numerical methods with much attention to modern linear systems solvers and generalized eigenvalue solvers These methods also have a broad applicability in industrial environmental and astrophysical flows The book is a must have reference for anyone working in scientific fields where fluid flow instabilities play a role Exercises at the end of each chapter and Python code for the bifurcation analysis of canonical fluid flow problems provide practice material to get to grips with the methods and concepts presented in the book

Towards Higher Categories John C. Baez, J. Peter May, 2009-09-24 The purpose of this book is to give background for those who would like to delve into some higher category theory It is not a primer on higher category theory itself It begins with a paper by John Baez and Michael Shulman which explores informally by analogy and direct connection how cohomology and other tools of algebraic topology are seen through the eyes of n category theory The idea is to give some of the motivations behind this subject There are then two survey articles by Julie Bergner and Simona Paoli about infinity 1 categories and about the algebraic modelling of homotopy n types These are areas that are particularly well understood and where a fully integrated theory exists The main focus of the book is on the richness to be found in the theory of bicategories which gives the essential starting point towards the understanding of higher categorical structures An article by Stephen Lack gives a thorough but informal guide to this theory A paper by Larry Breen on the theory of gerbes shows how such categorical structures appear in differential geometry This book is dedicated to Max Kelly the founder of the Australian school of category theory and an historical paper by Ross Street describes its development

Ergodic Theory, Analysis, and Efficient Simulation of Dynamical Systems Bernold Fiedler, 2012-12-06 This book summarizes and

highlights progress in our understanding of Dynamical Systems during six years of the German Priority Research Program Ergodic Theory Analysis and Efficient Simulation of Dynamical Systems The program was funded by the Deutsche Forschungsgemeinschaft DFG and aimed at combining focussing and enhancing research efforts of active groups in the field by cooperation on a federal level The surveys in the book are addressed to experts and non experts in the mathematical community alike In addition they intend to convey the significance of the results for applications far into the neighboring disciplines of Science Three fundamental topics in Dynamical Systems are at the core of our research effort behavior for large time dimension measure and chaos Each of these topics is of course a highly complex problem area in itself and does not fit naturally into the deplorably traditional confines of any of the disciplines of ergodic theory analysis or numerical analysis alone The necessity of mathematical cooperation between these three disciplines is quite obvious when facing the formidable task of establishing a bidirectional transfer which bridges the gap between deep detailed theoretical insight and relevant specific applications Both analysis and numerical analysis play a key role when it comes to building that bridge Some steps of our joint bridging efforts are collected in this volume Neither our approach nor the presentations in this volume are monolithic

Modern Methods in Scientific Computing and Applications Anne Bourlioux, Martin Gander, 2012-12-06 When we first heard in the spring of 2000 that the Seminaire de mathematiques superieures SMS was interested in devoting its session of the summer of 2001 its 40th to scientific computing the idea of taking on the organizational work seemed to us somewhat remote More immediate things were on our minds one of us was about to go on leave to the Courant Institute the other preparing for a research summer in Paris But the more we learned about the possibilities of such a seminar the support for the organization and also the great history of the SMS the more we grew attached to the project The topics we planned to cover were intended to span a wide range of theoretical and practical tools for solving problems in image processing thin films mathematical finance electrical engineering moving interfaces and

combustion These applications alone show how wide the influence of scientific computing has become over the last two decades almost any area of science and engineering is greatly influenced by simulations and the SMS workshop in this field came very timely We decided to organize the workshop in pairs of speakers for each of the eight topics we had chosen and we invited the leading experts worldwide in these fields We were very fortunate that every speaker we invited accepted to come so the program could be realized as planned

Sixth IUTAM Symposium on Laminar-Turbulent Transition Rama Govindarajan, 2006-01-18 The dynamics of transition from laminar to turbulent flow remains to this day a major challenge in theoretical and applied mechanics A series of IUTAM symposia held over the last twenty five years at well known Centres of research in the subject Novosibirsk Stuttgart Toulouse Sendai and Sedona Arizona has proved to be a great catalyst which has given a boost to research and our understanding of the field At this point of time the field is changing significantly with several emerging directions The sixth IUTAM meeting in the series which was held at the Jawaharlal Nehru Centre for Advanced Scientific Research Bangalore India focused on the progress after the fifth meeting held at Sedona in 1999 The symposium which adhered to the IUTAM format of a single session included seven invited lectures fifty oral presentations and eight posters During the course of the symposium the following became evident The area of laminar turbulent transition has progressed considerably since 1999 Better theoretical tools for handling nonlinearities as well as transient behaviour are now available This is accompanied by an enormous increase in the level of sophistication of both experiments and direct numerical simulations The result has been that our understanding of the early stages of the transition process is now on much firmer footing and we are now able to study many aspects of the later stages of the transition process
