nutritional status and weight gain can increase recovery and strength of individuals living with HIV AIDS improve dietary diversity and caloric intake and improve quality of life This book highlights evidence based research linking nutrition and HIV and identifies research gaps to inform the development of guidelines and policies for the United Nations Sustainable Development Goals A comprehensive approach that includes nutritional interventions is likely to maximize the benefit of antiretroviral therapy in preventing HIV disease progression and other adverse outcomes in HIV infected men and women Modification of nutritional status has been shown to enhance the quality of life of those suffering HIV AIDS both physically in terms of improved body mass index and immunological markers and psychologically by improving symptoms of depression While the primary focus for those infected should remain on antiretroviral treatment and increasing its availability and coverage improvement of nutritional status plays a complementary role in the management of HIV infection
