Ontogeny Cell Differentiation And Structure Of Vascular Plants:

Ontogeny, Cell Differentiation, and Structure of Vascular Plants Roger Buvat, 2012-12-06 With improved microscope and preparation techniques studies of histological structures of plant organisms experienced a revival of interest at the end of the 19th century From that time histological data have substantially studies of the pioneers in botanical science From the beginning of the 20th century the microscope allowed research in cell structure the general functional unit of living beings Advances in cytology gradually influenced histology at first however rather timidly Only the new and spectacular progress in ultrastructural cytology and cytochemistry led to a great increase in modern work on the structures of vascular plants and the related ontogenical and physiological data thanks to the use of the electron microscope and the contribution of molecular biology Not only did new techniques lead to new approaches but achievements in general biology shifted the orientation of research linking investigation to the physiological aspects of cell and tissue differentiation Among these the demonstration of the general principles of development and the characterization of molecules common to plants and animals which control and govern the main basic functions of cells and tissues have widened the scope of modern research on plant structures Present trends in biological research show that it is necessary to know the structures thoroughly from the ultrastructural cytological scale to the scale of tissue and organ arrangement even for physiological research on either cells tissues or whole organs The study of growth factors differentiation or organogenesis can be mentioned as an example
