## **Ontologies For Agents Theory And Experiences:**

**Ontologies for Agents: Theory and Experiences** Valentina Tamma, Stephen Cranefield, Timothy W. Finin, Steven Willmott, 2006-03-30 There is a growing interest in the use of ontologies for multi agent system applications On the one hand the agent paradigm is successfully employed in those applications where autonomous loosely coupled heterogeneous and distributed systems need to interoperate in order to achieve a common goal On the other hand ontologies have established themselves as a powerful tool to enable knowledge sharing and a growing number of applications have benefited from the use of ontologies as a means to achieve semantic interoperability among heterogeneous distributed systems In principle ontologies and agents are a match made in heaven that has failed to happen What makes a simple piece of software an agent is its ability to communicate in a social environment to make autonomous decisions and to be proactive on behalf of its user Communication ultimately depends on understanding the goals preferences and constraints posed by the user Autonomy is the ability to perform a task with little or no user intervention while proactiveness involves acting autonomously with no need for user prompting Communication but also autonomy and proactiveness depend on knowledge The ability to communicate depends on understanding the syntax terms and structure and the semantics of a language Ontologies provide the terms used to describe a domain and the semantics associated with them In addition ontologies are often complemented by some logical rules that constrain the meaning assigned to the terms These constraints are represented by inference rules that can be used by agents to perform the reasoning on which autonomy and proactiveness are based *Declarative Agent Languages and Technologies IV* Matteo Baldoni, Ulle Endriss, 2007-01-20 This book constitutes the thoroughly refereed post proceedings of the 4th International Workshop on Declarative Agent Languages and Technologies DALT 2006 held in Japan in May 2006 This was an associated event of AAMAS 2006 the main international conference on autonomous agents and multi agent systems The 12 revised full papers presented together with one invited talk and three invited papers were carefully selected for inclusion in the book **Advances in Practical Applications of Agents, Multi-Agent Systems, and Social Good. **Agent-based Supply Network Event Management** Roland Zimmermann, 2006-03-16 Supply Chain Event Management SCEM is one of the major topics in application oriented Supply Chain Management. However, many solutions lack conceptual precision and currently available client server SCEM systems are ill suited for complex supply networks in today's business environment. Agent based proactive information logistics promises to overcome existing deficits by providing event related information to all participants in the distributed environment. Hence, follow up costs of disruptive events are significantly reduced for all network participants and performance of a supply network is increased. In this book, a thorough analysis of the event management problem domain is the starting point to develop a generic agent based approach to Supply Network Event Management. The main focus lies on practical issues of event management, e.g. semantic interoperability and economic benefits to be achieved with agent technology in this state of the art problem domain.

*Multiagent based Supply Chain Management* Brahim Chaib-draa, Jörg Müller, 2006-10-11 This book takes a close look at recent progress in the field of supply chain management using agent technology and more specifically multiagent systems. Sixteen chapters are organized in four main parts: Introductory Papers, Multiagent Based Supply Chain Modeling, Collaboration and Coordination Between Agents in a Supply Chain and Multiagent Based Supply Chain Management Applications. The result is a comprehensive review of existing literature and ideas for future research.

**AGENT-BASED UBIQUITOUS COMPUTING** Javier Carbo, 2010-06-01 Ubiquitous computing names the third wave in computing where the personal computing era appears when technology recedes into the background of our lives. The widespread use of new mobile technology implementing wireless communications such as personal digital assistants PDAs and smart phones enables a new type of advanced applications. In the past years, the main focus of research in mobile services has aimed at the anytime anywhere principle of ubiquitous computing. However, there is more to it. The increasing demand for distributed problem solving led to the development of multi agent systems. The latter are formed from a collection of independent software entities whose collective skills can be applied in complex and real time domains. The target of such systems is to demonstrate how goal directed robust and optimal behavior can arise from interactions between individual autonomous intelligent software agents. These software entities exhibit characteristics like autonomy, responsiveness, proactiveness and social ability. Their functionality and

effectiveness has proven to be highly depended on the design and development and the plication domain In fact in several cases the design and developmentof effective services

shouldtakeintoaccountthecharacteristicsofthecontextfromwhichaserviceisrequested Contextis the set of suitable environmentalstates and settings concerninga user which are relevant for a situation sensitive application in the process of adapting the services and formation offered to the user Agent technology seems to be the right technology to offer the possibility of exploringthe dynamic context of the user in order to provideadded value services or to execute more and complex tasks
