Engineering United States Airways and Air Communications Service, 1956 Complex Scheduling Peter Brucker, Sigrid Knust, 2006-04-26 Scheduling problems have been investigated since the late fifties. Two types of applications have mainly motivated research in this area: project planning and machine scheduling. While in machine scheduling a large number of specific scheduling situations depending on the machine environment and the job characteristics have been considered, the early work in project planning investigated scheduling situations with precedence constraints between activities assuming that sufficient resources are available to perform the activities. More recently in project scheduling scarce resources have been taken into account leading to so-called resource constrained project scheduling problems. On the other hand, also in machine scheduling more general and complex problems have been investigated. Due to these developments today both areas are much closer to each other. Furthermore applications like timetabling, rostering or industrial scheduling are connected to both areas. This book deals with such complex scheduling problems and methods to solve them. It consists of three parts. The first part (Chapters 1 and 2) contains a description of basic scheduling models with applications and an introduction into discrete optimization covering complexity, shortest path algorithms, linear programming, network flow algorithms and general optimization methods. In the second part (Chapter 3) resource constrained project scheduling problems are considered. Especially methods like constraint propagation, branch and bound algorithms and heuristic procedures are described. Furthermore lower bounds and general objective functions are discussed. *Intelligent Decision-making Models for Production and Retail Operations* Zhaoxia Guo, 2016-06-27 This book provides an overview of intelligent decision making techniques and discusses their application in production and retail operations. Manufacturing and retail enterprises have stringent standards for using advanced and reliable techniques to improve decision making processes since these processes

have significant effects on the performance of relevant operations and the entire supply chain In recent years researchers have been increasingly focusing attention on using intelligent techniques to solve various decision making problems The opening chapters provide an introduction to several commonly used intelligent techniques such as genetic algorithm harmony search neural network and extreme learning machine The book then explores the use of these techniques for handling various production and retail decision making problems such as production planning and scheduling assembly line balancing and sales forecasting

A User's Guide to Spectral Sequences John McCleary, 2001 Spectral sequences are among the most elegant and powerful methods of computation in mathematics This book describes some of the most important examples of spectral sequences and some of their most spectacular applications The first part treats the algebraic foundations for this sort of homological algebra starting from informal calculations The heart of the text is an exposition of the classical examples from homotopy theory with chapters on the Leray Serre spectral sequence the Eilenberg Moore spectral sequence the Adams spectral sequence and in this new edition the Bockstein spectral sequence The last part of the book treats applications throughout mathematics including the theory of knots and links algebraic geometry differential geometry and algebra This is an excellent reference for students and researchers in geometry topology and algebra

Taillard,2022-10-29 This open

access book demonstrates all the steps required to design heuristic algorithms for difficult optimization The classic problem of the travelling salesman is used as a common thread to illustrate all the techniques discussed This problem is ideal for introducing readers to the subject because it is very intuitive and its solutions can be graphically represented The book features a wealth of illustrations that allow the concepts to be understood at a glance The book approaches the main metaheuristics from a new angle deconstructing them into a few key concepts presented in separate chapters construction improvement decomposition randomization and learning methods Each metaheuristic can then be presented in simplified form as a combination of these concepts This approach avoids giving the impression that metaheuristics is a non formal discipline a kind of cloud sculpture Moreover it provides concrete applications of the travelling salesman problem which illustrate in just a few lines of code how to design a new heuristic and remove all ambiguities left by a general framework Two chapters reviewing the basics of combinatorial optimization and complexity theory make the book self contained As such even readers with a very limited background in the field will be able to follow all the content **Operations Research**
