This chapter reviews the body of work in operations research in recent years which is devoted to health care delivery. Two important observations should be stated at the outset. First, although many problems faced by operations researchers in health care are not analytically different from problems in other industries, many others are quite unique due to certain characteristics of health care delivery systems. Some of these are the possibilities of death or low quality of remaining life, the difficulty in measuring quality and value of outcomes, the sharing of decisions among several decision makers (physicians, nurses and administrators), third party payment mechanisms for diagnoses and treatments, and the concept of health care access as a right of citizens in society. This chapter attempts to focus on areas involving these unique characteristics. Second, the breadth and richness of this field cannot be covered in the limited space here. Therefore problems, issues and principles are discussed with references provided for the inquisitive reader.

This chapter is separated into three major sections. First is system design and planning, which deals with large allocation decisions, both at the policy level and at the operational level. Second is management of operations, which examines monitoring and control methodologies at the operational and tactical levels. Third is medical management, which involves patient disease detection and treatment at the policy and at the patient levels.

## 1. System design and planning

### 1.1. Planning and strategy

In most industrially developed nations and in many developing nations, health care system design and planning occurs principally at the federal or regional level.
