

# OPTICAL PROPERTIES OF NANOMATERIALS

One of the most fascinating and useful aspects of nano materials is their optical properties. Applications based on optical properties of nano materials include optical detector, laser, sensor, imaging, phosphor, display, solar cell, photo catalysis, photo electrochemistry and biomedicine.

The optical properties of nano materials depend on parameters such as feature size, shape, surface characteristics, and other variables including doping and interaction with the surrounding environment or other nanostructures.

Likewise, shape can have dramatic influence on optical properties of metal nano structures. Emplifies the difference in the optical properties of metal and semiconductor nano particles. With the Cd Se semiconductor nano particles, a simple change in size alters the optical properties of the nano particles. When metal nano particles are enlarged, their optical properties change only slightly as observed for the different samples of gold nano spheres in. However, when an anisotropy is added to the nano particle, such as growth of nano rods, the optical properties of the nano particles change dramatically.
