Random Fourier Series with Applications to Harmonic Analysis Michael B. Marcus, Gilles Pisier, 1981 **Random Fourier Series with Applications to Harmonic Analysis** Michael B. Marcus, Gilles Pisier, 1981-01-01 Random Fourier Series with Applications to Harmonic Analysis Michael B. Marcus, Gilles Pisier, 1981-11-21 The changes to U S immigration law that were instituted in 1965 have led to an influx of West African immigrants to New York creating an enclave Harlem residents now call Little Africa These immigrants are immediately recognizable as African in their wide sleeved robes and tasseled hats but most native born members of the community are unaware of the crucial role Islam plays in immigrants lives Zain Abdullah takes us inside the lives of these new immigrants and shows how they deal with being a double minority in a country where both blacks and Muslims are stigmatized Dealing with this dual identity Abdullah discovers is extraordinarily complex Some longtime residents embrace these immigrants and see their arrival as an opportunity to reclaim their African heritage while others see the immigrants as scornful invaders In turn African immigrants often take a particularly harsh view of their new neighbors buying into the worst stereotypes about American born blacks being lazy and incorrigible And while there has long been a large Muslim presence in Harlem and residents often see Islam as a force for social good African born Muslims see their Islamic identity disregarded by most of their neighbors Abdullah weaves together the stories of these African Muslims to paint a fascinating portrait of a community s efforts to carve out space for itself in a new country Book jacket **Ergodic Theory and Its Connection with Harmonic Analysis** Karl Endel Petersen, 1995 Tutorial survey papers on important areas of ergodic theory with related research papers *Some Random Series of Functions* Jean-Pierre Kahane, 1985 The subject matter of *Some Random Series of Functions* is important and has wide application in mathematics statistics engineering and physics *Commutative Harmonic Analysis IV* V.P. Khavin, N.K. Nikol'skii, 2013-04-17 With the groundwork laid in the first volume EMS 15 of the *Commutative Harmonic Analysis* subseries of the *Encyclopaedia* the present volume takes up four advanced topics in the subject Littlewood Paley theory for singular integrals exceptional sets multiple Fourier series and multiple Fourier integrals Classical and Multilinear Harmonic Analysis Camil Muscalu, Wilhelm Schlag, 2013-01-31 This contemporary graduate level text in harmonic analysis introduces the reader to a wide array of analytical results and techniques Classical and Multilinear Harmonic Analysis: Volume 1 Camil Muscalu, Wilhelm Schlag, 2013-01-31 This two volume text in harmonic analysis introduces a wealth of analytical results and techniques It is largely self contained and will be useful to graduate students and researchers in both pure and applied analysis Numerous exercises and problems make the text suitable for self study and the classroom alike This first volume starts with classical one dimensional topics Fourier series harmonic functions Hilbert transform Then the higher dimensional Calder n Zygmund and Littlewood Paley theories are developed Probabilistic methods and their applications are discussed as are applications of harmonic analysis to partial differential equations The volume concludes with an introduction to the Weyl

calculus The second volume goes beyond the classical to the highly contemporary and focuses on multilinear aspects of harmonic analysis the bilinear Hilbert transform Coifman Meyer theory Carleson's resolution of the Lusin conjecture Calderón's commutators and the Cauchy integral on Lipschitz curves The material in this volume has not previously appeared together in book form     *Seminar on Stochastic Analysis, Random Fields and Application [sic]*. Robert C. Dalang, Marco Dozzi, Francesco Russo, 2002-04 This volume contains 20 refereed research or review papers presented at the five day Third Seminar on Stochastic Analysis Random Fields and Applications which took place at the Centro Stefano Franscini Monte Verit in Ascona Switzerland from September 20 to 24 1999 The seminar focused on three topics fundamental aspects of stochastic analysis physical modeling and applications to financial engineering The third topic was the subject of a mini symposium on stochastic methods in financial models     **Etale Homotopy of Simplicial Schemes** Eric M.

Friedlander, 1982-12-21 This book presents a coherent account of the current status of etale homotopy theory a topological theory introduced into abstract algebraic geometry by M Artin and B Mazur Eric M Friedlander presents many of his own applications of this theory to algebraic topology finite Chevalley groups and algebraic geometry Of particular interest are the discussions concerning the Adams Conjecture K theories of finite fields and Poincare duality Because these applications have required repeated modifications of the original formulation of etale homotopy theory the author provides a new treatment of the foundations which is more general and more precise than previous versions One purpose of this book is to offer the basic techniques and results of etale homotopy theory to topologists and algebraic geometers who may then apply the theory in their own work With a view to such future applications the author has introduced a number of new constructions function complexes relative homology and cohomology generalized cohomology which have immediately proved applicable to algebraic K theory     **Geometric Aspects of Functional Analysis** Ronen Eldan, Bo'az Klartag, Alexander Litvak, Emanuel Milman, 2023-09-29 This book reflects general trends in the study of geometric aspects of functional analysis understood in a broad sense A classical theme in the local theory of Banach spaces is the study of probability measures in high dimension and the concentration of measure phenomenon Here this phenomenon is approached from different angles including through analysis on the Hamming cube and via quantitative estimates in the Central Limit Theorem under thin shell and related assumptions Classical convexity theory plays a central role in this volume as well as the study of geometric inequalities These inequalities which are somewhat in spirit of the Brunn Minkowski inequality in turn shed light on convexity and on the geometry of Euclidean space Probability measures with convexity or curvature properties such as log concave distributions occupy an equally central role and arise in the study of Gaussian measures and non trivial properties of the heat flow in Euclidean spaces Also discussed are interactions of this circle of ideas with linear programming and sampling algorithms including the solution of a question in online learning algorithms using a classical convexity construction from the 19th century     **The Splendors and Miseries of Martingales** Laurent Mazliak, Glenn Shafer, 2022-10-17 Over the past eighty

years martingales have become central in the mathematics of randomness They appear in the general theory of stochastic processes in the algorithmic theory of randomness and in some branches of mathematical statistics Yet little has been written about the history of this evolution This book explores some of the territory that the history of the concept of martingales has transformed The historian of martingales faces an immense task We can find traces of martingale thinking at the very beginning of probability theory because this theory was related to gambling and the evolution of a gambler's holdings as a result of following a particular strategy can always be understood as a martingale More recently in the second half of the twentieth century martingales became important in the theory of stochastic processes at the very same time that stochastic processes were becoming increasingly important in probability statistics and more generally in various applied situations Moreover a history of martingales like a history of any other branch of mathematics must go far beyond an account of mathematical ideas and techniques It must explore the context in which the evolution of ideas took place the broader intellectual milieu of the actors the networks that already existed or were created by the research even the social and political conditions that favored or hampered the circulation and adoption of certain ideas This book presents a stroll through this history in part a guided tour in part a random walk First historical studies on the period from 1920 to 1950 are presented when martingales emerged as a distinct mathematical concept Then insights on the period from 1950 into the 1980s are offered when the concept showed its value in stochastic processes mathematical statistics algorithmic randomness and various applications

### **Combinatorics of Train Tracks**

R. C. Penner, John L. Harer, 1992 Measured geodesic laminations are a natural generalization of simple closed curves in surfaces and they play a decisive role in various developments in two and three dimensional topology geometry and dynamical systems This book presents a self contained and comprehensive treatment of the rich combinatorial structure of the space of measured geodesic laminations in a fixed surface Families of measured geodesic laminations are described by specifying a train track in the surface and the space of measured geodesic laminations is analyzed by studying properties of train tracks in the surface The material is developed from first principles the techniques employed are essentially combinatorial and only a minimal background is required on the part of the reader Specifically familiarity with elementary differential topology and hyperbolic geometry is assumed The first chapter treats the basic theory of train tracks as discovered by W P Thurston including recurrence transverse recurrence and the explicit construction of a measured geodesic lamination from a measured train track The subsequent chapters develop certain material from R C Penner's thesis including a natural equivalence relation on measured train tracks and standard models for

the equivalence classes which are used to analyze the topology and geometry of the space of measured geodesic laminations a duality between transverse and tangential structures on a train track and the explicit computation of the action of the mapping class group on the space of measured geodesic laminations in the surface
