[Raptor Biomedicine](#) Patrick Thomas Redig, [Virus Taxonomy](#) International Committee on Taxonomy of Viruses, Andrew MQ King, 2011-10-25. The practical need to partition the world of viruses into distinguishable, universally agreed upon entities is the ultimate justification for developing a virus classification system. Since 1971, the International Committee on Taxonomy of Viruses (ICTV), operating on behalf of the world community of virologists, has taken on the task of developing a single universal taxonomic scheme for all viruses infecting animals, vertebrates, invertebrates, and protozoa, plants, higher plants, and algae, fungi, bacteria, and archaea. The current report builds on the accumulated taxonomic construction of the eight previous reports dating back to 1971 and records the proceedings of the Committee since publication of the last report in 2005. Representing the work of more than 500 virologists worldwide, this report is the authoritative reference for virus organization, distinction, and structure.

**Ecology of Wild Bird Diseases** Sasan Fereidouni, 2024-06-14. The book focuses on the ecology of the most important infectious diseases of wild avian hosts, especially those with high morbidity and mortality rates. Disease ecology is an important scientific approach to study the relationships and interactions between living organisms, their environment, and potential pathogens. Birds have high diversity and the very special ability to fly and migrate. They migrate over long distances and share ecosystems with other animals, even humans. They serve as the most important natural source of several pathogens with zoonotic potential. Bird pathogen interactions are increasingly changing due to the continuous anthropogenic disturbances in habitats and ecosystems. With intensified climate change and improved environmental conditions for vectors, as well as higher susceptibility of avian hosts due to simultaneous exposure to environmental stressors, e.g., contamination, food limitation, etc., the probability of emerging new infections and their expansion into new territories increase tremendously. The COVID-19 pandemic has shown that neglected ecological and epidemiological interactions between wildlife, domestic animals, and humans are paramount to global health. The book has a different approach to understanding complex and multiscale interactions among various ecological factors for the most important infectious diseases of wild birds. It provides valuable data to students and everyone who deals with avian species, including biologists, researchers, conservationists, and policymakers.

West Nile Encephalitis Virus Infection Michael S. Diamond, 2009-02-12. West Nile virus is a neurotropic flavivirus that has emerged globally as a primary cause of viral encephalitis. Infection of humans and other vertebrate animals is associated with a febrile illness that can progress to a lethal encephalitis or flaccid paralysis syndrome. Its appearance in the Western Hemisphere in 1999 and the corresponding increase in global disease burden over the last decade have been accompanied by intensive study, including the entry of many scientists into the field. Breakthroughs have been made in understanding the unique transmission pattern between the vector and the multiple avian and mammalian hosts and targets. Studies in mammalian systems have dissected the viral and host factors that determine the pathogenesis and outcome of West Nile virus infection. On the basis of these experiments, progress has been made on the identification of genetic factors that predispose to severe human disease. Thus, in a remarkably short period of time, insight has been gained on a wide variety of disciplines related to West Nile virus biology. The aim of this book was to assemble an up-to-date and cutting-edge anthology from the leading experts in the field. The chapters are balanced by

submissions from newcomers who have made significant recent contributions with those from established investigators who have dedicated their careers to the study of West Nile virus      Emerging Avian Disease Ellen Paul,2012-05-02 This volume of Studies in Avian Biology resulted from a Symposium on Avian Disease at the North American Ornithological Conference held in Veracruz Mexico in October 2006 The diverse set of topics addressed in the contributed chapters include the evolutionary and ecological aspects of the host vector systems of avian infectious disease effects of genetic variation introduction success and vector ecology evolution of resistance and virulence of pathogens and effects of changing geographic distributions In addition to empirical studies under field conditions the authors have developed predictive models to assess the movement and potential impact of these diseases Other chapters delve into the potential impacts of pathogens on ornithological research and the key role of ornithological science in biosurveillance and documenting impacts of disease on bird populations Provided by publisher      Infectious Diseases of the Dog and Cat Jane E.
