We study of the Re-entry Vehicle (RV) motion about of mass center in the planetary atmospheres by regular and chaotic dynamics methods

The dynamics of a rotating body studied famous mathematicians of all time as Euler, Poinsoi, Lagrange and Kovalevskaya. The research of the dynamics of rotating bodies is very important for numerous applications such as the dynamics of satellites and re-entries. In this area we note the papers scientists as Yaroshevsky, Belezky, Rumyantsev, J.Nicolaidis, G.Gross, C.Murphy et al.

Doman, William B. Blake, 2006 A method for estimating the effects of nose cone ablation on the aerodynamic forces and moments of a reentry vehicle is presented The method provides a means of generating a rough but representative model that makes use of interpolated test or prediction data using instantaneous nose cone mass as an interpolation variable An interpolation function is proposed that can be used to approximate the location of points on the outer moldline as well as the aerodynamic characteristics between node points While the changes in overall vehicle mass properties due to ablation are typically small one can make use of the interpolated outer mold line information to estimate mass properties such as moments of inertia or center of gravity The interpolated aerodynamic and mass properties provide a means for generating data for dynamic simulations for use in vehicle proof of concept studies Advances in Guidance, Navigation and Control Liang Yan, Haibin Duan, Yimin Deng, 2025-03-03 This book features the latest theoretical results and techniques in the field of guidance navigation and control GNC of vehicles and aircrafts It covers a wide range of topics including but not limited to intelligent computing communication and control new methods of navigation estimation and tracking control of multiple moving objects manned and autonomous unmanned systems guidance navigation and control of miniature aircraft and sensor systems for guidance navigation and control etc Presenting recent advances in the form of illustrations tables and text it also provides detailed information of a number of the studies to offer readers insights for their own research In addition the book

Candy, 2005-10-13 A unique treatment of signal processing using a model based perspective Signal processing is primarily aimed at extracting useful information while rejecting the extraneous from noisy data If signal levels are high then basic techniques can be applied However low signal levels require using the underlying physics to correct the problem causing these low levels and extracting the desired information Model

based signal processing incorporates the physical phenomena measurements and noise in the form of mathematical models to solve this problem. Not only does the approach enable signal processors to work directly in terms of the problem's physics, instrumentation and uncertainties, but it provides far superior performance over the standard techniques. Model-based signal processing is both a modeler's as well as a signal processor's tool. Model-Based Signal Processing develops the model-based approach in a unified manner and follows it through the text in the algorithms, examples, applications and case studies. The approach coupled with the hierarchy of physics-based models that the author develops, including linear as well as nonlinear representations, makes it a unique contribution to the field of signal processing. The text includes parametric, e.g., autoregressive or all-pole sinusoidal wave-based and state-space models as some of the model sets, with its focus on how they may be used to solve signal processing problems. Special features are provided that assist readers in understanding the material and learning how to apply their new knowledge to solving real-life problems. Unified treatment of well-known signal processing models, including physics-based model sets. Simple applications demonstrate how the model-based approach works, while detailed case studies demonstrate problem solutions in their entirety, from concept to model development through simulation, application to real data and detailed performance analysis. Summaries provided with each chapter ensure that readers understand the key points needed to move forward in the text, as well as MATLAB® Notes that describe the key commands and toolboxes readily available to perform the algorithms discussed. References lead to more in-depth coverage of specialized topics. Problem sets test readers' knowledge and help them put their new skills into practice. The author demonstrates how the basic idea of model-based signal processing is a highly effective and natural way to solve both basic as well as complex processing problems. Designed as a graduate-level text, this book is also essential reading for practicing signal processing professionals and scientists who will find the variety of case studies to be invaluable. An Instructor's Manual presenting detailed solutions to all the problems in the book is available from the Wiley editorial department. NASA Thesaurus, 1967
