The Principal Diseases of Lower Vertebrates H. Reichenbach-Klinke, E. Elkan, 2013-10-22 The Principal Diseases of Lower Vertebrates presents the material published by Heinz H Reichenbach Klinke between 1957 and 1962 in three separate volumes as *Krankheiten der Aquarienfische* Alfred Kern Stuttgart *Krankheiten der Amphibien* and *Krankheiten der Reptilien* Gustav Fischer Stuttgart The scope of the work has been enlarged with material contributed by E Elkan who has also done the translation Representatives of the main groups of parasites affecting fish have been presented as far as possible The book is organized into three parts covering the diseases of fishes amphibians and reptiles Experience has shown that those who keep or are interested in one kind of lower vertebrate will sooner or later also take an interest in one of the other groups It was therefore thought expedient to include what is at present known of lower vertebrate pathology in one volume even at the risk of some repetition where fishes amphibians and reptiles suffer from similar diseases or are the victims of identical parasites

**The Mechanosensory Lateral Line** Sheryl Coombs, Peter Görner, Heinrich Münz, 2012-12-06 This volume represents the published proceedings of an international conference on the Neurobiology and Evolution of the Mechanosensory Lateral Line System held August 31 to September 4 1987 at the Center for Interdisciplinary Research at the University of Bielefeld West Germany The goal of this conference was to bring together researchers from all over the world to share information about a major aquatic sensory system the evolution and function of which have largely remained an enigma since the 18th century The lateral line or lateralis system has been used as an umbrella term to describe what originally without the aid of modern anatomical techniques looked like a series of pits grooves and lines on the head and trunk of fishes and some amphibians For at least the past 30 years however it has been recognized that the lateralis system comprises not one but at least two functional classes of receptors mechanoreceptors and electroreceptors The relative ease with which the appropriate stimulus could be defined and measured for the electroreceptive class has resulted in an explosion of information on this submodality during the past 20 years As a result there is little ambiguity about the overall function of the electrosensory system now generally regarded as an independent system in its own right A similarly clear definition for the function of the mechanosensory lateralis system has not been as forthcoming
