Bacterial Flora in Digestive Disease C. Scarpignato, Ángel Lanas, 2006-01-01 Hundreds of bacterial species make up human gut flora The intestine has at least 400 different species of bacteria totaling over 10¹² organisms Of these 99% are anaerobic bacteria The gastrointestinal tract is then exposed to countless numbers of bacterial species and foreign antigens and has embedded a unique and complex network of immunological and non immunological mechanisms to protect the host from potentially harmful pathogens Healthy individuals are generally tolerant to their own microbiota but such tolerance is impaired in patients with both organic and functional gastrointestinal diseases The advancement of the knowledge on microbial gut interactions in health and disease has allowed a more pathophysiologically oriented approach to several challenging clinical conditions There are currently two ways to manipulate enteric flora Antibiotics can selectively decrease

tissue invasion and eliminate aggressive bacterial species or globally decrease luminal and mucosal bacterial concentrations depending on their spectrum of activity Alternatively administration of beneficial bacterial species probiotics poorly absorbed dietary oligosaccharides prebiotics or combined probiotics and prebiotics synbiotics can restore a predominance of beneficial commensal flora These two therapeutic approaches are not of course mutually exclusive Rifaximin a poorly absorbed antibiotic targeted at the gastrointestinal tract has been long used in Italy for the treatment of infectious diarrhea in both adults and children During the past few years the appreciation of the pathogenic role of gut bacteria in several organic and functional gastrointestinal diseases has increasingly broadened its clinical use which now covers hepatic encephalopathy small intestine bacterial overgrowth inflammatory bowel disease and colonic diverticular disease Other potential clinical indications are being explored and look promising
